No socialist Canadian....the folks don't actually hate us. They just want what we have, and not pay for it. Your 'kind' showed its true colors recently when we asked for assistance in Iraq. If you think that won't have unhappy consequences for your nation, you are mistaken.

Think about it.....asshole liberal puke. Oh there I go again calling you names.

Tell ya what 'Private' call your local mountie and tell him to come get me.....looooooosssssseeeerrrr.

Dan/W4NTI

And, of course, you can prove that no "raghead" genes sneaked into
your White family tree during The Crusades.

Of course, the "ragheads" who raped and pillaged Italy and France
during The Crusades couldn't possibly be part of your family tree,
could they?

Think of it this way...This thread helps you set the kill
files/filters so it cleans up the group and you are more likely to see
something worth while.

Personally, I thought most of the regs here were a little more adult than all this...

IMHO, all human beings deserve respect, unless they personally have done something to negate that right. However, I do believe also that anyone who has an opinion on any subject should have the intestinal fortitude to make themselves known. This, too, is part of respect.

Where I do not condone Dan's attitude toward some ethnic groups, he does have a right to voice it, and he does make known not only whom, but where he is by use of his ham call. I didn't read the complete thread, so I don't know what these others said, but it would seem that they, too, allowed it known to whom to attribute what was said. For this, despite their political views, they have my respect.

Please, though.. name calling is so juvenile, and unnecessary. This isn't PC, it's good, old fashioned, good manners.. something we could use a lot more of nowadays. (Funny thing, isn't it, how PC gets pushed, but things never get any better?)

Well, Brenda Ann, and all the rest that can't stand it when I say what I
think. Why don't you jump on 'Private' ??? The jerk that called me a racist
and put my address on the internet, soliciting 'ragheads' to come here and
attack me.

Is that allright? Does that fit well with your American standards?

Tell ya what , I'll make it real simple.   When attacked...I attack back.

Dan/W4NTI

Ummm... Dan.... actually, I was much more 'jumping on' "Private" than you.

Try re-reading my post, and then make your comment (or apology?). What I
very succinctly said was that though I do not agree with your politics, I
support your right to voice them, and respect the fact that you do so
without anonymity...

The jerk that called me a racist and put my address on the internet,
soliciting 'ragheads' to come here and attack me.
>
> Is that allright?

I thought it was cool when he "did it" to me. I sign all my posts with my call, and there are callbooks everywhere, so the only thing he really allegedly "did" was to threaten to send some angry raghead my way. Gee, I'm scared about that... (Not!)

As for being called a "bigot" by an apologist for ragheads, I couldn't work up too much concern over that.

Historical note: Almost every african who was ever captured and sold in the americas to slavery was captured by arab slavers who had been infesting the congo basin for more than five hundred years. They were there centuries before the brief opening of the market for slaves in america, and were there long after it closed.

The arab slavers would typically take an entire village at a time, murdering anybody who was either strong enough to resist, or too weak to make the long walk on a long, heavy chain to market. Pregnant women and small children were typically murdered because they did not travel well. There is documented evidence of arab slave-raids in the congo basin going on as late as the mid-1950's. The great majority of the african natives captured over those centuries were of course used by the arabs themselves.

The progeny of the africans who were sent to the americas are living free lives in a free country today. As far as can be seen, there are no surviving progeny from the much greater number of africans who did not go to the americas but instead were used by the arabs. Perhaps this is so because castration of slaves has always been a common practice among the arabs.

... So when an apologist for this uncivilized, backward and violent tribal culture calls me a "bigot", I can't help but smile at the irony there.

Overall, I guess this doesn't bother me because I expect anybody who sticks up for the raghead set to be some kind of an uncivilized jerk anyway, so I wasn't surprised by his behavior. He didn't say or do anything interesting or unusual. He acted pretty much as you would expect an uncilized jerk to act.

(Yawn)

Charles Brabham, N5PVL

Yes indeed. I was in a rush. Having re-read YOUR post I tender my apology.
For the rest.....I stand by my statements. And I don't hide from anyone
later....eh "Private" ???

Our coalition is helping the Iraqi people to build a secure, hopeful and
self-governing nation which will stand as an example of freedom to all

the Middle East,'' George W.Bush said [in his radio address].

G.W.Bush's father also sent the army to Kuwait to liberate the Kuwaitis
from the same dictator they had helped prop up against Iran. Then there
was a man called Oliver North...

Reagan's administration was heavily involved in helping the Afghani
mujahedeen against the Soviets. Yes, that same Bin Laden.

Holy shit, you're right! They are uncivilized jerks!

What ever happened to the American ideal
Freedom of Religeon?
IF you are American and rebel against what we stand for
what religeon is it that you advocate that all must adhere to
so that they are not to be killed ?
Are there any other citizens of this country that you disagree
which you advocate their demise?
Art Unwin

Looks like Daniel L. Jeswald (W4NTI) and Charles D. Braham (N5PVL) will think twice before making racist remarks on these groups. I still can't believe they wrote it and may actually think that way.

In any case, DANIEL! you are in your late fifties for crying out loud. Grow up! What would your 4 children and 5 grandchildren think. There must be more than a couple black or arab people in Anniston Alabama, think of how they would feel if they knew what you wrote. You have done some nice work in Anniston, don't pee it all away over some racist remarks. Applogize or at the very least keep it to yourself.

Thank you. Apology graciously accepted.

Take care, and stay well.

Lighten up, life is short. :)

That statement IS tongue-in-cheek, right? By far the largest part of the world's population no doubt doesn't view us at all, doesn't even (or barely does) know we exist (billions in India and China). Of those that do know we exist, most see us as decadent, Godless, and hedonistic. And, thanks to the press at large, that we live in fear of criminals taking our lives and property (and that our guns only make this worse).

Some (those that are allowed to know from whence comes their aid) see us as generous. Those that know our basic political system (without the embelishment of their local government propaganda) see us as democratized, though most poor countries see us otherwise.

Just my observation of the world press.. YMMV

> will think twice before making racist remarks on these groups.

I haven't made any racist remarks. What I have done is to characterize arabs as "rag-heads"... That is not a racial slur and could not be, as there is no "arab race". There are a number of arab tribes though, characterized by the habit of wearing a rag on their heads. You can call it anything you like, but it's still a rag to me. Get the picture?

You are right about one thing. If I were ever tempted to make a racist remark, I would most certainly think twice. The situation never comes up though, so I guess its a moot point, isn't it?

If arabs wish to be respected, they'll just have to do like everybody else and start acting respectably. The best, most accurate description I have heard of the various arab "governments" today characterizes them as "crapulent kleptocracies".... Between that, the insistence upon anti-american propaganda in the arabs schools (where they exist), the mistreatment of arab and enslaved foriegn women by cowardly, vile arab men, and the refusal to stop supporting civilization's terrorist enemies, there's just not a lot to respect in arab culture. It stinks from top to bottom.

That's my opinion. If you don't like it, come up with one of your own. But please - stop whining and snapping like a cur when confronted with opinions that you do not like to hear. Try to pick up a little manhood, somewhere.

Charles Brabham, N5PVL

RE,

In 'reality' TROTW's view is much simpler.
- - - They (USofA) Got It.
- - - We Want It !

It ended when the Muslims of this world decided to attack and kill
Westerners, just because they were Westerners.

It was further solidified by 9/11.

Mr. Bush is not correct on this issue. It is a war against Muslims. And,
guess what? we will win it. They will not be allowed to infiltrate this
country and destroy it from within. It was tried by the Communists, and
they failed.

The Muslims started it. We will end it.

Have a nice day

Dan/W4NTI

Too bad that, by attacking Iraq, he attacked one of the most secular of Arabic countries. There are now more Al Qaida in Iraq than before.

What Iraq had to do with 9/11 I'll never understand.

Having gone through one 9-11, we went took steps designed to forestall us having to go through another. Of course it is much more complicated than that, but you'll find that this basic motivation is always there.

If you are having trouble understanding these issues, then you are probably reading the wrong news sources. Shop around and look for better sources of information. Round-file the ones you are using now. They're not doing the job.

Just think, had we focused on Bin Laden, the one actually responsibly for 9/11, instead of running off on some wild war based on a perceived threat, we might already have the true culprit.

I swore to myself I wouldn't get involved in this thread, but, being attracted to Ham Radio because of the supposed international handshakes, I'm a sucker for trying to get along with the rest of the world.

You could search the entire world and not find a better place to fight
terrorists. A major sandbox surrounded by ragheads that need their ass
kicked.

Bush is a genius. Rummy is a genius. You will see.

Let me ask you this; Would you rather have these ragheads blowing up
Boston?

> essential for my project.

Look at the diagram.   A zero is a change in state; doesn't matter
in which direction it changes.   If you invert the input signal the
```

output is still the same:

```
> >    __    ________    _____          __
> > __|  |__|        |__|     |________|

    --    --          --       --------
      |__|  |________|  |_____|        |__

> >   0  0  0  1  1  0  0  1  0  1  1  0
```

Same output.

// marc

```

I'm not sure what you mean by "generic." In order to effect change, you need to be specific. In order to initiate legislation or court directives, you have to be precise in what you're asking for. I'm volunteering to help you in your cause if you are serious.

By "non-ham links" do you mean message forwarding with non-ham systems or do you mean forwarding with other licensed amateurs over the internet? I have no intention of forwarding with anyone without an amateur radio license and have always actively blocked those messages in the past.

I'm aware of the TexNet situation. Replacing 9.6k links with high performance redundant messaging paths could also be called evolution. Look, I'm not advocating replacing RF links with the internet. I'm advocating using the internet to enhance an already existing messaging system.

As for my "juvenile challenge," I'm just saying that if you believe so
strongly in your cause, show it with action instead of endless whining and
reminiscing about the way ham radio used to be 20 years ago. I'm
volunteering to help you put an end to the same debate that's been going on
here for years. I'd be happy with a decision in your favor or mine.

Try 40 meters late at night. The band goes long starting about 10PM and I
talk to people in Texas, Mexico, and Cuba, and even into South America
almost every night.

73,
Jeff
N0WJP

> have on his car.

Yup, that's the key. "... on his car ...".

What do you think about the guys who bring jet airplanes
to the meet and then tell you your racers are boring, slow,
and the wave of the future is airplanes. Then he gets all over
the strip and won't go away and you don't get to race anymore.

Does that help you locate a clue?

I think you need to start taking your medications again. Your head must be about ready to explode with so much blood out of circulation.

Anyone who thinks FEMA needs Hams to do its job is severely crippled in the brain department. They laugh when a bunch of old men show up with their talkies to help in an emergency, and to get them off their back, they assign them to the chuck wagons, or water-boy stations. FEMA is equipped to drive into any town and blow away any problem. That one rig they have can instantly hook-up to the national infrastructure outside the disaster area, that Hams are left scratching their asses.

Hams missed the boat on microsats. They were the first in space with that concept, and then they threw it away, and spent all their money (millions) on the Phase-III pig that is mostly off on any pass over the US.

I've asked at our club how many are going to buy the AOR digital voice modem (designed by a UK Ham), and they all just laughed and asked what could it do that our repeater or BBS can't! After telling them how it would improve long distance communications, and voice quality in the same space as SSB, they just shrugged. Who cares! SSB is good enough they said. Hoo-rah said the amen corner...

Sorry, Mr. Director, it's a dead hobby. Made up of dead people in line to get their SK award from the ARRL (who hasn't changed leadership in 20+ years).

Gene, ex-Ham

No.

```
     __    ________    _____          __
  __|  |__|        |__|     |________|
```

means the same as

```
  __    __          __       ________
    |__|  |________|  |_____|        |__
```

in that a zero is represented by a change, in either direction,
and a one is no change.

No, Hank. I just know that if you want to win the game, you have to do more than stand on the side and take pot shots at the other team. You probably don't have the mental horsepower to remember, but the last time you and I had this discussion was on packet. My messages to you were going out the hf port on my fbb system to W8AKF and your replies were going through about a dozen internet hops to get back to my system through WB0TAX. Looks like I had a better rf path than you did.

If you don't like something, do something about it. Don't just sit around and whine.

73,
Jeff
N0WJP

My replies went directly to N0RVX. Right near you.
Why wouldn't he forward to you? Guess ...
You know all that, but you lie about it.

> If you don't like something, do something about it. Don't just sit around
> and whine.

Why? Seems you have not paid attention to what I've been doing
the past 5 years or so. Sharp stick. Poke in eye of Land Line Lid

Ya killed the RF network, good for you. Why should I care?

Yes, that is precisely the attitude of packet networkers who simply refuse to allow non-ham links within their network. It works every time, too! The LandLine Lids get shut out - and all of a sudden, they are not such a problem anymore. Things start working better.

This has demonstrated that as hams, we can self-police this problem in the US very effectively. Still, a federal prohibition on inteference by persons hooking up unwanted non-ham links within an amateur radio network would still be a good idea.

Only the packet networks that ban non-ham links are currently growing and advancing, so it's just a matter of time, as they say...   ;-)   Still, we should not let this lead us to a complacent, tolerant attitude about what amounts to malicious interference, especially where our ability to provide emergency communications is being undermined.

Most of the progress so far has been made with VHF/UHF networks, but HF still needs work and is vital to re-establishing a global all-ham radio digital network. Hams who would like to be part of the solution in this area should contact me at n5pvl@uspacket.net , or post at the new USPN Forum.

Right now, both the FCC and several manufacturers of amateur radio equipment have unfavorable opinions about EchoLink and IRLP, from what I gather. Did you read this month's Op-Ed in QST? With digital voice coming up soon, this would be an excellent time to cut the Internet umbilical entirely so that ham radio can resume its job of providing alternative, independent communications. This will go far in getting the hobby back on track, while protecting it from vandalism.

Internet forwarders are insects, parasites, blood-suckers who feed off of and infect something several orders of magnitude greater than themselves. Being parasites, they naturally are big proponents of the parasitic lifestyle, frequently expressing disdain for their host and calling others to join them in their mindless insect gluttony.

The thing they have to watch out for is Ham Radio getting irritated, and deciding to scratch it's ass. We can do that by promoting a "No non-ham links within a ham radio network" rule, either among ourselves through self-policing, or more definatively through involving the federal government. Everywhere it has been tried, it has resulted in a re-energized, faster growing, more advanced packet radio network. You can't beat a deal like that.

Charles Brabham, N5PVL

>   I'd be better off using version 2.2?

Because it is the latest (and last) "official" specification.
Been a really long time since I looked at 2.0 vs. 2.2 and all
the other suggestions that were floating around at the time.

Work done since then has improved the protocol quite a bit,
but has not been submitted to the ARRL other than via the
conference procedings. So there is no "AX.25 L2V2.3"
or whatever. Many current implementations do the additions,
and those additions have proved to be quite useful.

For a very simple implementation you can just ignore digipeating :-)
i.e. if an incoming frame has digipeaters, ignore it.

You mentioned "students" working on this project, and I assumed
"Computer Science 101" students. If that assumption is wrong then
my suggestions would be along the lines of "find existing code, and
modify or use it." Perhaps if you give some more ideas on what
you are up to, others will post some suggestions.

Actually, there wasn't an RF path on UHF or VHF between Omaha and Des Moines. I'm not sure what hf frequency RVX was on, but I was on 14.098 and he wasn't there. I'm not lying about anything. RVX never told me he didn't want to forward.

As for what you've done for the last five years, I think that you've spent a lot of effort spewing out negative opinions on everything rather than mentoring hams who want to learn more about packet networks or maybe showing them how to forward using HF. The guy who helped me set up my HF port spent many hours teaching me how things worked, why they worked, and how HF

forwarding is different from VHF. It was a great learning experience and
I'm looking forward to getting back on an HF network.

Here's a question for you. I have a good friend who's a ham. He has a
microwave path from Omaha to Des Moines on a frequency that is shared
between ham radio and other services. Ham frequency, ham license. If I
forward over that link would you call that acceptable? By the way, his
company is an ISP and the link is his backbone connection to Des Moines, but
he's a licensed ham and he's running over frequencies allocated to both
amateir radio and other services.

73,
Jeff

Great. I'm glad it's working for you. What does that have to do with my
gateway? What would you say if internet forwarders decided not to allow any
stations that forward via RF links because they're so slow compared to
internet links?

>
> This has demonstrated that as hams, we can self-police this problem in the
> US very effectively. Still, a federal prohibition on inteference by
persons
> hooking up unwanted non-ham links within an amateur radio network would
> still be a good idea.

I think you'd have a hard time claiming interference. You still haven't
answered my question. By non-ham links do you mean forwarding with non-ham
systems or do you mean travelling over links that are not amateur radio
(such as the internet)?

>
> Only the packet networks that ban non-ham links are currently growing and
> advancing, so it's just a matter of time, as they say...   ;-)   Still,
> we should not let this lead us to a complacent, tolerant attitude about
what
> amounts to malicious interference, especially where our ability to provide
> emergency communications is being undermined.
>
That's great. Eventually they might even upgrade to something faster than
1200 baud. Put things in perspective. Manufacturers stopped shipping 1200
baud modems in 1988 because they were obsolete technology. Why would you
build a new network on something like that?

> Most of the progress so far has been made with VHF/UHF networks, but HF
> still needs work and is vital to re-establishing a global all-ham radio
> digital network. Hams who would like to be part of the solution in this
area
> should contact me at n5pvl@uspacket.net , or post at the new USPN Forum.
>

I looked at your forum. Doesn't look like you have any takers.

> Right now, both the FCC and several manufacturers of amateur radio equipment have unfavorable opinions about EchoLink and IRLP, from what I gather. Did you read this month's Op-Ed in QST? With digital voice coming up soon, this would be an excellent time to cut the Internet umbilical entirely so that ham radio can resume its job of providing alternative, independent communications. This will go far in getting the hobby back on track, while protecting it from vandalism.
>

I didn't see QST, but the AES catalog I got about a week ago has some radios from Icom that are digital and even have ethernet ports. Looks like manufacturers are promoting digital voice, not abandoning it. I think Alinco has had an HT with digital capability for a couple of years. Yaesu is selling it's WIRES interface. Do you think you can get one of those things passing digitized voice over a 1200 baud packet link?

> Internet forwarders are insects, parasites, blood-suckers who feed off of and infect something several orders of magnitude greater than themselves. Being parasites, they naturally are big proponents of the parasitic lifestyle, frequently expressing disdain for their host and calling others to join them in their mindless insect gluttony.
>

You're a real poet.

> The thing they have to watch out for is Ham Radio getting irritated, and deciding to scratch it's ass. We can do that by promoting a "No non-ham links within a ham radio network" rule, either among ourselves through self-policing, or more definatively through involving the federal government. Everywhere it has been tried, it has resulted in a re-energized, faster growing, more advanced packet radio network. You can't beat a deal like that.
>
> Charles Brabham, N5PVL
>

Go for it. Re-energize America's packet radio infrastructure. I'm glad you have a cause to keep you busy.

73,
Jeff

Just a guess -- but I think they are at about AE6OQ or there abouts
See QRZ as this was issued on 10 October, 2003

You can also use WM7D site for "yesterday's issues" URL:
http://www.wm7d.net/fcc_uls/call_report1.shtml

or choose the archives for each day.

Also World Radio Magazine gives the lasest series of callsigns
Ham Radio Outlet carries the magazine
Perhaps a subscriber can look up the latest issue.

It is possible. Long ago LX0HST in Luxembourg used to allow shell
access. The system was running Linux. I am in Minneapolis, Minnesota.
LX0HST wasn't on HF, but could be accessed from other stations. I used
to access LX0HST by connecting to DJ0OW on 20 meters, then telling DJ0OW
to connect to LX0HST. There were other paths besides DJ0OW too, I seem
to remember doing it via ON0BEL (?) many times. There were other
gateways in Germany as well. This was all done with PACTOR-II.

I am not sure if LX0HST was connected to the internet, but if it was, I
could have easily accessed anything from the shell.

MixW2 will receive Pactor level 1, but won't transmit. This is not a technical, but rather a licensing issue. Seems that www.scs-ptc.com and the MixW authors did not come to an agreement.

Greetings,

Since the current larger sunspot group is making national news, it seemed like a good time to press this subject. In his ARLP040 Propagation de K7RA of Oct 3 Tad Cook said it far better than I could so will share his thoughts.

"
Grim news emerged recently concerning the NOAA Space Environment Center in Colorado, where most of the data for these bulletins originates. I suspect due to some misunderstanding about their work, the Senate Appropriations Committee wants to eliminate the Space Environment Center's budget for fiscal year 2004, which officially began October 1. The Senate Appropriations Committee said in a report that NOAA's work should only be terrestrial and not extend to space, so it's proposing to cut all funding for the SEC. The House appropriations bill proposes cutting funding by 40 percent, even in the wake of severe cuts during the fiscal year just ended.

The funny thing about the Senate report is that all of the effects of solar flares and sunspots that concern us are here on Earth. Claiming that NOAA should ignore the sun because it is in space seems silly, since the same standard doesn't apply to NOAA's conventional weather forecasting. The SEC is a small part of NOAA, with an annual budget of just 8 million dollars.

There's a story on this subject on the ARRL Web site (see ''Space Environment Center Funding in Jeopardy'' http://www.arrl.org/news/stories/2003/10/03/3/). The Seattle Post-Intelligencer ran a story in its October 2 editions http://seattlepi.nwsource.com/national/142217_space02.html, and there's an item on the September 20 SpaceWeather.com Web page, available in the archive for that date http://spaceweather.com/archive.php .

I've contacted my representatives in the Senate and House and found that, as expected, staff members really had no idea what the obscure sounding Space Environment Center does. The only hope is that when the House and Senate committees work out that portion of the budget, funding for the SEC will somehow be preserved. You might contact your representatives to inquire about this. Members of the Senate Appropriations Committee are listed on the committee's Web site http://appropriations.senate.gov/ .
"

I sincerely apologize for posting to 5 groups, but this subject is very important and has not been seen, or I missed such, in any.

Regards,
Jim - KU5S

Why does this surprise you? Look at the way gobernment does bizness. Look at the FCC jumping up and down about PLC/BPL and too ignorant to understand the problem. Nuff said.

Totally unhelpful and irrelevant response. And you of course had to quoted
the entire message and also place your remarks at the bottom. :)

I see that you are using windows, if you throw that out and install
linux instead then there's a solution:

http://sourceforge.net/projects/hfterm/

The project description says:
hfterm - linux ham radio soundcard digimode program, can transmit
PACTOR I (unique !), also AMTOR, GTOR, RTTY

Correct Dan. Bush has 87 BILLION to dump into the re-building of Iraq (a country who's people would stab us in the back the minute it's turned..) and yet cuts the budgets of the VA Hospital, Medicare, Roads and Public Works and other domestic programs.

No....He want's to give those oil rich sandniggers 87 Billion at NO LOAN. (more like a bribe for them to behave)

Watch and see as Bush "Act II popcorn man" becomes a one-term President. He's making the same mistakes as his daddy did in 92 and the Democrats will eat him and the GOP alive in 04. Clinton may have been a pot smoking womanizer, but the checks still came thru every Friday and more people were working when he was running the show in the O. Office.

In the end Iraq will go the way of Iran, watch it in 5 Years.

I know...did it tick you off?  Good.  You don't want to read what I say.
Killfile it.  I could care less.

Wouldn't surprise me a bit. I thought from the git-go that Iraq would turn into a quagmire. Unfortunatly for those fighting the fight, it is serving a purpose. It is keeping the ragheads 'occupied'. And its not in Boise Idaho.

As for your political commentary. As far as I'm concerned the Democratic party left me when they turned it over to NOW and Phyliss.

That does NOT mean I support Baby Bush 100%. However lets see how things go.

"J Tabor" <denews@taborsoft.com> wrote in
news:vpgpjbahqjtod5@corp.supernews.com:

How's this for irrelevant? You make a post urging a response from the readers, and then endeavor to alienate them by grading their posts. I can see you holding little cardboard signs, and with marker in hand, you write your score on the card then hold it up for the judges.

You wouldn't happen to be an Amateur Astronomer, would you? When I used to be into the hobby, I noticed that many of the Amateurs were quite dysfunctional personality wise. (I know that in my case it's kind of like the kettle calling the pot black, figuratively, of course).

To know and to be, this is not even a question, there is no alternative. You see it clearly in the loneliest little avenues between particles and waves, shunned even by the gregarious quark and unknown by the various strands of time, so big it cannot be seen, yet so little it is immovable, lies the fabric of the ultimate reality gripped in the fist of the all or nothing."

Those names worked OK for me... I immediately knew exactly who he was talking about. So did you.

You should be ashamed for being a PC pick-a-ninny.

Oh, he's gotta be shaking in his boots NOW! Haw Haw Hawr!   :D

That reminds me of an interview that occurred back in 1967, right after the Israeli 6-day war. Israel had been attacked on all sides by a number of raghead states, who were determined to murder every Israeli man, woman, and child in Israel. (According to the raghead newspapers of the time.)

Of course we all know what happened. Despite having almost no outside support, and with only a few obsolete old French aircraft, the Israelis thoroughly kicked every one of those ragheads countries' asses, taking some of their land from them instead, just to teach the uncivilized scum a little lesson.

Asked about his astounding success in mowing down thousands of screaming raghead fanatics with very few casualties (sound familiar?) , the Israeli general agreed to give the reporter the exclusive secret to his unprecedented military success...

"Fight Arabs." he said.

Charles Brabham, N5PVL

"charlesb" <n5pvl@sbcglobal.net> wrote in
news:I0Mmb.12434$%62.5271@newssvr29.news.prodigy.com:

Oh, was that the very same year that Israel ruthlessly and without provocation attacked the U.S.S Liberty? This was done by the same people that still chase phantasms of Holocaust perpetrators nearly 55 years after it ended, while claiming that the U.S.S. Liberty issue has been "resolved" or "closed".

http://ussliberty.org/ excerpts follow:

"During the Six Day War between Israel and the Arab States, the American intelligence ship USS Liberty was attacked for 75 minutes in international waters by Israeli aircraft and motor torpedo boats. Thirty-four men died and 172 were wounded."

"Israel claims they mistook our ship for the out-of-service Egyptian horse carrier El Quseir and that we brought the attack upon ourselves by operating in a war zone without displaying a flag. Not so. We were in international waters, far from any fighting, and flew a bright, clean, new American flag. The flag we flew is on display at the National Cryptologic Museum, Fort Meade, Maryland and can be seen there, or in the USS Liberty Images Archive."

http://home.cfl.rr.com/gidusko/liberty/

http://www.washington-report.org/backissues/0693/9306019.htm

http://www.logogo.net/liberty.htm

http://www.yellowtimes.org/article.php?sid=399 excerpts follow:

"(YellowTimes.org) � June 8 marked 35 years since Israel attacked the USS Liberty without warning in international waters, killing 34 Americans and wounding 172 more. The Israelis lied about it and persuaded our Congress to look the other way, and they are still lying about it today. But the Liberty will not go away. Every attempt to hide this story seems to bring more attention.

This past year brought a 60-minute documentary produced by CBS News Productions that was broadcast by The History Channel on Aug. 9 - much to the dismay and over the heated objections of the Israeli Embassy and various spokesmen for Israel who did all in their power to block it."

http://www.lewrockwell.com/orig/margolis12.html excerpts follow:

"At 0800 hrs, 8 June, 1967, eight Israeli recon flights flew over 'Liberty,' which was flying a large American flag. At 1400 hrs, waves of low-flying Israeli Mystere and Mirage-III fighter-bombers repeatedly attacked the American vessel with rockets, napalm, and cannon. The air attacks lasted 20 minutes, concentrating on the ship's electronic antennas and dishes. The 'Liberty' was left afire, listing sharply.

Eight of her crew lay dead, a hundred seriously wounded, including the captain, Commander William McGonagle.

At 1424 hrs, three Israeli torpedo boats attacked, raking the burning 'Liberty' with 20mm and 40mm shells. At 1431hrs an Israeli torpedo hit the 'Liberty' midship, precisely where the signals intelligence systems were located. Twenty-five more Americans died.

Israeli gunboats circled the wounded 'Liberty,' firing at crewmen trying to fight the fires. At 1515, the crew were ordered to abandon ship. The Israeli warships closed and poured machine gun fire into the crowded life rafts, sinking two. As American sailors were being massacred in cold blood, a rescue mission by US Sixth Fleet carrier aircraft was mysteriously aborted on orders from the White House."

http://zog.to/3/liberty/lib-ind.htm excerpt follows:

"In June 1967 jet aircraft and motor torpedo boats of Israel brutally assaulted the American naval intelligence gathering ship USS Liberty. The attack was preceded by more than six hours of intense low-level surveillance. The attack lasted more than two hours, killing 34 Americans and wounding 171 others, and inflicted over 821 rocket, cannon and machine-gun holes in the ship..."

http://www.counterpunch.org/stclair1126.html

"After more than two hours of unremitting assault, the Israelis finally halted their attack. One of the torpedo boats approached the Liberty. An officer asked in English over a bullhorn: "Do you need any help?"

The wounded commander of the Liberty, Lt. William McGonagle, instructed the quartermaster to respond emphatically: "Fuck you."

I believe that evidence of Israel's "at times" inhuman treatment of others in the pursuit of their own safety comes from the increasing numbers of individuals in their own military that refuse specific missions. Few would fault an officer of the law or soldier in the military that takes positive and at times fatal actions against individuals or groups actively seeking to kill others. But in missions designed for revenge purposes against the Palestinians for terror perpetrated by some of them, Israeli military personnel are now, and have been over the years, experiencing soldiers refusing to do as ordered.

To know and to be, this is not even a question, there is no alternative.
You see it clearly in the loneliest little avenues between particles and
waves, shunned even by the gregarious quark and unknown by the various
strands of time, so big it cannot be seen, yet so little it is
immovable, lies the fabric of the ultimate reality gripped in the fist
of the all or nothing."

I cannot believe these two posts below.  Charles D. Braham, you are
worse then Dan L. Jeswald who started the thread making racist
remarks.  You guys just don't get it do you, where does it stop?
Arabs? Black people? Both of you are discusting....

Did you know your racist remarks are illegal?  How do you think a
Black or Arab person feels about your remarks?  Maybe one will visit
you and explain how they feel.....

If your so proud of your politically correct stance, why the heck are you
posting behind a screen name?

You are a low life bastard posting addresses of those you disagree with ,
while hiding in the dark.

Most politically correct types are. They are a gutless, spineless breed that hide behind everything possible and when it's safe to come out of thier holes, they snipe and take pot shots at everything that is good and decent, if not just anything that doesn't fit thier sleazy, terrible, hate-filled agenda.

N.O.W., Earth First!, the ACLU and other yellow bellied organizations like that are now quickly losing all clout and political strength they have because they have gone to the well of jealousy & race conflict just one time to many to drink from, and now thier paying the price.

Good riddance to bad rubbish.

Clint

This is in essence what NSA does with as much of the RF spectrum
as they can, all over the globe. They have no idea what they have,
but if you can tell them the time, the general location, and the
frequency, they will hook up a receiver onto their data log, and
look around for the signal. This is just what they did when that
KAL plane was shot down, and NSA came up with the com signals of
the fighters that did the deed.

Hello,

I have a kenwood thf6a in good condition that I would like to trade
for a kam xl. If you are interested in it, email me at
kb2sdrjay@yahoo.com

Not only that, they decrypted the secure voice! If you listen to the audio
you can tell it was originally narrow-band secure voice, which was common
in the Soviet Air Defense forces and interceptors.

Hmmmmm... It's interesting to speculate that you could get all excited about doing this, build the required equipment, use your old spark transmitter and coherer, and be talking with someone who is using just the same equipment at the other end, except that his _equipment_ is "virtual". That is, he just uses processing power to emulate a spark transmitter's emissions...

;-)

Thanks, but no thanks. I'd rather enjoy the challenge of communicating through all the degradations that happen to waves propagated through the air. It doesn't bother me one way or the other if others adopt the technique, though.

Cheers,
Tom

It should bother you, Tom. This guy's response to the BPL problem was to give us software that simulates being on the air. Not only is it contrary to the spirit and purpose of the hobby, but worst of all, it encourages us all to be discouraged. It gives the weakesat among us an easy out, at the cost of adding still more to the hobby's difficulties.

So far, the idea of using non-ham links in order to "improve" the performance of amateur radio has been 100% consistent. In every case where it has been applied, it has managed to set back and denigrate the hobby, to some extent or another.

I am sorry to hear that this invasion of non-ham stuff into the hobby does not bother you. It sure should.

Charles Brabham, N5PVL

I'm not discouraged. If BPL eats up the HF spectrum I'll be one of those still able to communicate by listening to the CW signals change the noise and copy the changes as code.

Don't laugh, I've done it before.

Am I to understand that we are all going belly-up and cave in to BPL?

Perhaps Mr. Stinson is trolling for the power companies. I, for one, have not given up the fight against BPL. Perhaps all the good Republican HAMS and SWLrs should write their congressmen and the President who has appointed the majority of the FCC and suggest that their right to the spectrum is on a par with that to bear arms. The FCC is effectively limiting our free speech by jamming our frequencies.

I view BPL as a means of restricting my access to shortwave freqs in much the same way the Chinese jam freqs from Nepal. But, of course, the present administration would never do anything to restrict our access to global views which may call their agenda into question.

I propose that we start sending electricity through our TV cables as a backup to our outdated electrical system. I am "putting down the marker" for PCTV, Power through Cable TV! We would only need one connection for our TVs, and VCRs.

Sorry Dave, your idea lacks the purity derived from the radio - ether - radio connection. Let's not divert our energy away from stopping BPL before it gets out of control. BTW, you wouldn't be a BPL advocate, would you?

I don't know if you are joking or if something that bizarre has really
crossed your mind. I love a good sense of humour.

Hi,

I'm looking for some info on NRZI coding. google gives me useless links...
nothing special. I am about to write someting that uses NRZI but i can not
find any specification.

I appreciate any input on this.

Regards,

Mariusz SP3FXC

I'm in the process of installing JNOS 111f for Linux and have run into a problem. When a user sends a message to another local user, the system responds with a "Msg queued" message, but the message is never delivered. If I log in as Sysop, I can't see any messages. If I look in the /spool/mqueue I can see all the messages sitting there.

Anyone have any suggestions on where to start?

Thanks,
Jeff

I haven't run JNOS in several years, but you might try the following--as sysop, issue the command 'smtp list' and you should see the list of messages. 'smtp kick' should try to run the queue. At that point 'tcp status' should give a hint of what is/isn't happening.

==============
Perhaps not from a summer cottage ,but remote operation of HF stations has been done in California and Hawaii
since the mid 90s .Access and operation is through a hand-held VHF radio.
Even a rotator can be operated remotely.
The brainchild of a aviator/engineer living in the Brea (California) area it was/is called a Super-Station .
However in this scheme rx and tx are co-located.
The system was elaborately explained by its designer/implementor in 1995 at a meeting of the Fullerton Amateur Radio Club.

I can understand that with antenna restrictions/ prohibition in urbun areas and a possible emergence of BPL / PLC / PLT ,people are looking into alternative ways to communicate on the HF bands.
Fortunately in a number of countries BPL et al has already been rejected by the authorities , Japan and the Netherlands come to mind. I believe also in the UK ,it is highly unlikely that powerline comms will be accepted.

ARRL's drive to block the introduction of power line comms in the USA ,by means
of 'competent (engineering) reasoning' ,must be applauded.

1. Toss "JNOS" into the bit-bucket.

Get an old 386 or 486, install DOS and FBB BBS. This combination will be more reliable and trouble-free than the LINUX/JNOS combo. It requires less than 20% of the setup time that your present system does, have a better human interface, and in a general sense it will just plain work better. Part of the reason for this is that the author of FBB BBS is a much, much better programmer than the author of JNOS, not to mention all the anonymous junior programmer wanna-bees that have peed on JNOS, over the years. That code is a real mess, now. - The inevitable result of "open sewers" programming technique.

You will find that operating genuine packet BBS software running over DOS to be a real pleasure, after struggling with Linux/JNOS. It must be remembered that JNOS' "BBS" functions are the result of a poorly-done hack of legitimate BBS software, by a "programmer" who obviously did not have the concept of packet BBS operation very clear in his mind. Even when it works, nobody likes it because the interface sucks so hard. All that "area" crap, etc... It's just a waste of time.

After years of bad-mouthing packet BBS's, the truth finally came out when amateur tcpip enthusiasts discovered that hardly ANYBODY wanted to operate NOS. The ham tcpip community responded to this fact by inexpertly hacking basic BBS functions onto various flavors of "NOS", in a desperate bid to get some significant number of hams to tolerate the weird NOS software. This effort failed to make NOS popular, but at least it did lay to rest all those years of bad-mouthing BBS stations. It made it plain that amateur tcpip enthusiasts know that packet BBS systems are the best way to go. They had to pretend to be packet BBS's, in order to get anyone to use thier software at all.

If you install DOS, FBB, and FlexNet, your station will preform better on the air than any packet system available for Linux. The Linux stuff depends upon the obsolete KISS protocol, nice stuff in the 1980's but definately third-rate in this day and age. If you want the latest packet technology from the 1980's, stick with JNOS/Linux. If on-the-air performance is important to you, then you want FlexNet.

Of course it may be that you are running Linux/JNOS because you hope to run a packet/internet gateway... In that case, the DOS/FBB/FlexNet setup would not work for you, and the best thing you can do is to send your ham liscense back to the FCC, sell your ham equipment and buy yourself some FRS and CB gear.

Hope this helps!

That would be a good homework project, but not really all
that useful, just implement using the 2.2 specification.

Consider adding the PE1CHL enhancements, per the ARRL
networking conference procedings, Volume 14 I think.

Might as well design for these from the start, the protocol
works much better if you include them:

Extended sequence numbers via SABME.
No fixed maximum frame size.
Adaptive FRACK via measured RTT.
Slow start a la TCP.
Selective reject and out-of-sequuece receive frame queueing.

Good research projects:

Adaptive frame size.
Is FRMR really useful?

There is a good deal of source code available, some good,
some very bad. Google will turn it up for you.

Not really. The guy wanted to know how to get the JNOS software to behave
and I gave an honest answer as to how I would solve the problem. - I would
round-file the JNOS software, and go from there.

I used to test and review packet software, and found JNOS to be the very lousiest excuse for packet radio software I had ever seen. Despite that, I did manage to get it working, at least good enough so that I could test its functionality for a fair review, so I am familiar with the unnecessary head-aches and poor on-the-air performance this guy is putting up with.

I gave the guy a little historical info about the software he was using, and pointed the way to more modern software that will do a better job with a lot less trouble. I was working on the assumption that the guy was not a masochist, but just wanted a reliable packet radio BBS that would work without constant massaging and tinkering, or embarassing malfunctions that lose people's messages.

I suppose that you are free to run me down for trying to help the guy out, but notice that I won't say a single word about you being an obvious "protocol warrior", still stuck back in the 1980's.

> find any specification.

If you look at this with a monospaced font (Courier for example) it
should make sense:

```
   __    ________    _____          __
__|  |__|        |__|     |________|
  0  0  0  1  1  0  0  1  0  1  1  0
```

Non-Return Zero Inverting means (1) the signal does not return
to a resting state after a bit, and (2) a zero is indicated by
a change of state, and a one by no change. Clock is extracted
from the data, which means there must be a limit to the number
of consecutive 1's, and the "zero stuffing" technique leads to
a bigger discussion.

NRZI encoder:

Invert the NRZ data, then apply to both the J and K inputs of a J-K flipflop; clock to the clk input of the FF. Q output of the FF is the encoded NRZI data.

NRZI decoder:

Encoded NRZI data to both the input of a D flipflop and one input of an XOR gate. Q* (Q-not) output of the D-FF to the other input of the XOR gate. Clk to the clk input of the FF. XOR output is the decoded NRZ data.

Thanks for the suggestions, Charles, but FBB is the whole reason I'm looking at JNOS. I ran it for several years and found it to be very unreliable and unable to integrate with gateway software. I used FBB to run the local packet BBS here in Omaha and to forward on VHF, UHF, HF, and the internet. FBB is great for talking to other FBB systems, but not too good at talking to anything else.

And yes, I plan to gateway this system through the internet. I'll hold on to my ham license, though. I need it for my 10-15 hours I spend each week on HF either on 7.261 or working cw on the low end of 40.

And speaking of obsolete systems, where would I buy a copy of DOS if I wanted to run FBB? I haven't seen one for almost 10 years.

73,
Jeff

Well, to tell the truth, Jeff, you are the second person I've ever heard
talk about FBB BBS software being "unreliable". The other complainer was a
LandLine Lid, too, so I'll assume it's the non-ham stuff that you are having
trouble with.

You can imagine how broke up I must be, over you experiencing difficulties
while trying to screw up.

> And yes, I plan to gateway this system through the internet. I'll hold on
> to my ham license, though. I need it for my 10-15 hours I spend each week
> on HF either on 7.261 or working cw on the low end of 40.

Don't count on your messages being delivered to or by the genuine amateur radio stations in the BBS forwarding net. Gateway stations have caused so much damage to the fowarding network that many BBS forwarders are now refusing to handle traffic either coming from or going into any LandLine Lid system. Several of the more destructive LansdLine Lid stations have been isolated this way, to reduce the amount of damage that they can do.

There are now large sections of the country where non-ham stuff is not allowed to participate in the Ham Radio network at all. Your messages will not be delivered there. LandLine Lid stations there can chat with each other on the Internet, as usual, but are not allowed to disrupt the activities of genuine amateur radio packet network. You will probably be "forwarding" (internet chatting) with some of these lonely, out of place LandLine Lid stations, keeping a miserable trickle of messages going for them.

Remember that the packet radio HF forwarding network is an association of amateur radio operators who work to implement HF digital links. Your non-ham links are not welcome amongst these hams who are trying to use radio, and your operation within that group with your non-ham links will- to the extent that it is tolerated - cause disruption within the network, making it harder for hams to use radio as intended for this purpose.

- But you already know all that, Jeff, and don't care. That's the kind of "ham" that you are, aren't you?

You know, this kind of destructive, disruptive LandLine Lid "protocol war" behavior was bad enough back in the 1980's... Back then, it decimated the existing HF forwarding network and disrupted packet communications across the USA, and it was all chalked up to "protocol wars", as if that was any justification for deliberately disrupting amateur radio communications. These days, with the ARRL affiliated with Homeland Security, your disruptive, anti-ham activities may have a little bit more serious consequences that they might have had ten years ago.

I sincerely hope that it does. You are an insect, Jeff, that really deserves to be squashed. I consider anybody who deliberately denigrates and undercuts the ham digital network as you intend to do, during this time of war against terrorism to be beneath contempt. What used to be despicable enough as "protocol warrior" behavior back in the 1980's can now end up costing people's lives and property, disrupting our ability to as hams to provide emergency communications in the event of a terrorist attack or disaster.

There is literally no excuse for the disruptive, destructive activity you propose.

I didn't say it was newer, I said it was more reliable and did not require
so much tinkering. You can get copiies of DOS all over the place. Try an
interenet search, or get somebody to show you how to do one.

Yeah, I'm in real trouble now.

Charles, why don't you join us in the 21st century? It's attitudes like yours that have made ham radio just a "curiosity" rather than a community of dedicated experimenters who develop new communications technology before the commercial interests can do it. If I'm an insect, then you're an antique.

As for HF forwarding I guess we'll wait and see. I'll attempt to get back into HF forwarding once my VHF, UHF and microwave links are back up.

73,
Jeff

```

Hi,

Has anybody come across a program which allows you to raise and lower the individual lines on a serial port? I am looking for something to check out some lines that are being used for discrete outputs. Not that hard to write, but before I reinvent the wheel, I wanted to see if it had already been done.

Alan

Ah yes! The dedicated Land Line Lid!
Spouting the same drivel and lies they all do.

"Why not advance ham radio by using the internet instead of radio!"
Sir, you are an idiot.

Davit Tait's FPP, a PIC programmer driver, has a test mode that allows you to wiggle the individual lines. Funny you should ask, I was just doing that.

http://people.man.ac.uk/~mbhstdj/piclinks.html

Keep in mind if you are using NT/W2K/XP you need to get some driver software like DIRECTIO since the operating system won't allow you to twiddle the ports directly.

Jeff,

I'm not familar with JNOS but this sounds like a routing problem.

Does each local user have their own mail queue? Under linux, each user has a file under /var/spool/mail. Mail coming into the box is transferred into a file under /var/spool/mail by the sendmail program. Sendmail looks up each destination address in an 'aliases' file (/etc/aliases or /etc/mail/aliases), if it isn't found there it is written into a file in the /var/spool/mail directory. The file is given the name of the destination address (i.e. the local user). If it is found in the aliases file, the real name stored in the aliases file is substituted for the destination address and then the message is written into the correct file under the /var/spool/mail directory.

It sounds like you either have no program like sendmail looking at the incoming mail queue in order to deliver it locally or your local users are not defined to the linux system.

Does JNOS have a mail transport agent process that perhaps isn't getting started? Are all local users defined properly?

I hope this gives you a place to start.

Very good :) One more question. Is it "level-sensitive" coding? I mean if we change the phase (by 180deg.) of NRZI coded signal would it be still readable when it hits decoder? I need to verify this because it is essential for my project.

Mariusz

Hey Bub, you're the one pushing the latest packet radio technology from the 1980's... Your "protocol warrior" attitude is 1980's vintage as well. You're the antique, OM... Your bogus attitude is as obsolete as the bogus software you are struggling with.

Insect.

I run around with some Drag racing guys (Top Fuel, Funny Cars, Gassers, etc),
and just like Hams, they are super-critical about what a "true hot rodder" should
have on his car.  I know for a fact that these guys blow shit up even if it was
gold
plated, but yet they keep buying the same shit because everyone else will label
them a traitor or a poster-boy for some manufacturer.  There's some people who
can't operate without negative peer pressure.  They wrap their positive messages
in
negative slants about one thing or another.

You can't change them, and they are too stupid to change themselves.

Yes, you are right, Gene... In this case, Internet junkies think it's cool to disrupt the amateur radio hobby because ham radio is not "IP", or it's not "fast enough", or - whatever. (Insert anti-ham sentiment or whiney excuse here.) You can't change them, and they are too stupid to change themselves.

Kind of like a guy who insists upon sneaking a little nitro to his tank in a gas competition so that he can "win", LandLine Lids undermine the entire concept of Amateur Radio (Using Radio, Duh!) by using Internet links as part of the packet radio network and so are not really "winners"... They are just disruptive jerk-offs. - You can't change them, and they are too stupid to change themselves.

Insects.

Ham Radio is a much more serious hobby than hotrodding, in that a central part of our reason for being is to provide independent, alternative emergency communications during the course of a disaster or emergency. The activities of amateur radio operators save lives and property. We do this by developing and maintaining day to day ham radio communications so that we will be there in time of need. This has become even more important since the 9/11 attack, as the subsequent affilliation of the ARRL with the Dept. of Homeland Security would indicate to anybody who is not completely brain-dead.

Non-ham communication links have no place whatsoever within an amateur radio network, as they are the very type of communications that we are supposed to be backing up. - Hopefully a few of us here are intelligent enough to understand the fact that you cannot "back up" a communications system that you are utterly dependent upon. - It would be like having a special telephone number to call, in case the phones go dead. - Useless in your hour of need.

So when insectoid types disrupt the ham radio hobby by imposing unwanted, inappropriate non-ham links within our amateur packet radio network, they are not just being jerkoffs, they are directly endangering human lives and property by interfering with the ability of amateur radio operators to fulfill one of our primary reasons for being - emergency communications.

Tell you what, Gene... I'll send an note to the Dept of Homeland Security and see how they feel about people deliberately interfering with hams trying to provide alternative, independent emergency communications capability. They may have some suggestions for dealing with persons who insist upon undercutting and interfering with amateur radio operators engaged in activities related to our affiliation with Homeland Defense, or may know who to talk to in the FCC about this matter. There's really no reason for hams to have to tolerate this kind of disruptive, irresponsible behavior any more.

Charles --

Put your money where your mouth is. If you're interested in really seeing what the Department of Homeland Security thinks about the issue, please drop them a note about me. I'd be happy to be your "test case" on internet forwarding. My contact info is good in the callbook and QRZ.COM.

I'll make you a deal. If they agree with you that internet forwarding should not be allowed for the purposes you have listed, then I'll gladly disconnect my system from the internet and unconditionally apologize to you here or in any forum you choose. If they decide that internet forwarding poses no threat from their perspective, you can apologize to me here and stop harassing those of us who would like to use the internet for forwarding in addition to RF. Do you have the nerve to back up what you say?

Also, if you're able to work HF, then I hang out on 7261 or thereabouts after 10:00PM central time (usually 7281 before 10) and would love to have you check into the 1721 group. They don't have anything to do with packet or forwarding, but they're a great group of people and everyone's welcome.

73,
Jeff

Hank, I'm glad to see you have the same closed mind and "in the box" thinking that you did a couple of years ago. My friend, I spend most of my time in this hobby working different modes on HF, VHF, UHF and microwave and almost no time on packet.

If you feel better calling me a land line lid, then have at it. Also, take a look at my earlier reply to Charles. You can feel free to put your money where your mouth is, too.

73,
Jeff

> Charles --
>
> Put your money where your mouth is. If you're interested in really seeing what the Department of Homeland Security thinks about the issue, please drop them a note about me. I'd be happy to be your "test case" on internet forwarding. My contact info is good in the callbook and QRZ.COM.

You'll have to settle for being "generic" unless that kind of detail is actually called for. There are dozens of gateway stations. What I will be doing is demonstrating how the imposition of non-ham links into the amateur radio digital network has undercut and interfered with that network, a result of packet/internet gateways being unregulated in the United States.

I'm in a good position to do that, as I was a participant in the global HF digital network that existed prior to the introduction of non-ham links, and am aware of the mechanism by which those unwanted non-ham links destroyed the network within just a few years. It's fairly easy to demonstrate, and most packet enthusiasts who were around at the time are familiar with how it worked. There was a two-pronged approach, where some HF forwarders were starved for traffic to send, while others were grossly overloaded, way beyond capacity. Prior to the introduction of the non-ham links, the global HF net had operated smoothly and reliably. It was and still is the most significant example of global cooperation among ham radio operators - ever. Unregulated gateways destroyed that.

I was also intimately associated with an advanced, large-scale VHF/UHF packet radio network (TexNet) that started replacing it's existing 9.6kb backbone links with Internet connections, and totally self-destructed within a few years of that move. When the Internet became widely available, all of the large-scale VHF/UHF packet networks naturally took a hit. - But all of them survived and are now growing again except TexNet, which is the only big packet net to completely disappear from the face of the Earth. At one time it had over 100 nodes, covering three states. All gone, now. Non-ham links are the kiss of death.

I can demonstrate packet networks located overseas that operated under regulations that did not allow the imposition of non-ham links. Without exception, those networks continued to advance and grow the entire time the US network, and the global HF net were disrupted and lost coherency. Those folks use 9.6kb - 19.2kb for access these days, with a lot of the backbone being 19.2 fulldup to 72.8 fulldup. All ham radio, with voice over packet and neat stuff like that. This network has a footprint of close to 600-800 miles, maybe better. Nice what you can accomplish, when you stay on-mission and concentrate on doing things with radio. I do not think it will be hard to demonstrate that we should be doing that in the US, too. All we need is a reg that forbids the insertion of non-ham links into a ham radio network, so we can get back on-mission again.

Did you know that prior to the introduction of non-ham links into the US packet network, we provided leadership to the world in this area with the most widespread, sophisticated packet network on the planet?

I can also demonstrate that the only rapidly growing packet network in the US today (140+ nodes in a few years) specifically does not allow non-ham links. They simply shut offenders out of the system, and stick with radio. They have the fastest growing, most advanced packet network in the US to show for it.

The thing about this is: There is no recorded case of a large-scale VHF/UHF network surviving the wide-spread imposition of non-ham links. The global HF network was killed by non-ham links as soon as the Internet made them available. By way of contrast, there is no record of a packet network that banned non-ham links which has not steadily advanced and grown, the whole time. If you graph it, you can show a direct relationship between the imposition of non-ham links and the decline of a packet radio network's performance and utility. It has the same end effect as malicious interference, and should be regulated as such, for that reason.

Note: The idea is ban non-ham links within the ham network, not the use of gateways. Gateways are important because they provide a way for the two networks to communicate with each other, so don't look for me to propose throwing tossing the baby out with the bath water, as some have suggested. The idea is to be able to provide effective, alternate emergency communications, and gateways are essential for that task, among others. ANY tool can hurt you if you use it improperly, and can also be of great benefit if you don't grab the wrong end of it. All we need is a reg that prohibits improper use of gateways.

>
> I'll make you a deal. If they agree with you that internet forwarding should not be allowed for the purposes you have listed, then I'll gladly disconnect my system from the internet and unconditionally apologize to you here or in any forum you choose. If they decide that internet forwarding poses no threat from their perspective, you can apologize to me here and stop harassing those of us who would like to use the internet for forwarding in addition to RF. Do you have the nerve to back up what you say?

I have the nerve to back up anything I say, but that does not mean that I will accept a juvenile challenge as you have put forward here. What I will do is send a note to the Homeland Security folks, as I said.

>
> Also, if you're able to work HF, then I hang out on 7261 or thereabouts after 10:00PM central time (usually 7281 before 10) and would love to have you check into the 1721 group. They don't have anything to do with packet or forwarding, but they're a great group of people and everyone's welcome.
>

Thanks, but I hardly ever get lower than 30 meters, or use a mike on HF these days. I live at the extreme southern tip of Texas, so its doubful that we could hear each other on 40 meters in any case!

Charles Brabham, N5PVL

In article <ae650e79.0310061330.57e8803d@posting.google.com>, trp950
@hotmail.com says...

> I am thinking about moving abroad and would like to set up an internet connection from a VERY remote location. Is it possible to do it via shortwave radio?

Possible how?

In the technical sense, of course it's possible. The technology to do so (via satellite) exists now, and is available to those who know where to look and who to pay subscription fees to.

In the logistic and licensing sense, it's a much more complicated issue. You'd probably be best off investigating a satellite feed with existing technology. A google search for "satellite internet" (include the quotes) turns up a whole raft of hits, including such names as Starband and DirecPC.

Good hunting.

Depends what you mean by internet connection.
Mail access is possible using one of these systems:
http://www.winlink.org/ (ham radio operators only)
http://www.sailmail.com/
http://www.kielradio.de/

To expand on that, Internet connection via HF amateur radio is possible, but not for any kind of web surfing or high bandwidth activity. Email and some Usenet would be about the limit. And even for email, you'd better have good spam filters. One 155k "Microsoft Security Update" would ruin your whole week.

Text web access with Lynx _might_ work, except that many pages don't support text-only any more. Imagine surfing at 300 bps, then add packet overhead. No encryption, so you might have some security problems too.

How remote is "VERY"? Using a higher frequency will allow higher bps rates, but with shorter range. *IF* there are digipeaters anywhere close, you might be able to get a faster connection, but with more hops.

Heh, I remember when VHF packet was four times faster than normal landline modems.

Hello group,

I am a cruising sailboat owner. I have been using the Pactor Winlink
network for email but I was wondering how difficult it would be to
setup a station to use the packet forwarding capabilities of the Ham
satellites. There are limitations on a sailboat of course. Big dishes
are out and because of the rocking and rolling motion, directional
antennas are probably out too.
Anyway, does anyone know where I can find some info on how to setup
such a system.

73,

Jeannette

Thanks for reading this.

I need a Windows-compatable program or TSR
(can be DOS, as long as it will run on a Windows machine)
that will give me an open audio channel, sound card to sound card,
from one internet-connected computer to another.
Needs to have good bandwidth for broadband connections,
scalable down to narrower bandwidth for dial-up.
Need to pass at least 15-20 KCs of bandwidth for broadband,
4-6 KCs for dial-up.
Don't need any bells or whistles. Does need to maintain the
channel once opened. I can rig some kind of hardware "transmit,"
but that would complicate the application.
 Can anyone help?
Thanks again and 73,
Dave AB5S

Sorry for the xpost. My buddy John WB2ISI recently passed away and his widow w/ 3 children under 18 asked me to dispose of his equipment as follows:
Yaesu YS200 Watt/SWR meter
Kenwood 2 meter transceiver TR-7850 w/ mic. slight wear, missing rt side panel.

Icom IC751
AIM 20 amp power supply
National NC-33 Receiver, fair appearance, no dents/dings, power cord needs work.
Tubes:

http://www.speakfreely.org/
it is free, comes with source code and is GPL-ed.
the voice quality is really excellent and
it has choice of codecs to choose from.

Thanks for reading this.
I have today submitted an article to QST magazine entitled
"Virtual Spectrum: Beating BPL at its own game,"
detailing a concept that can greatly impact our radio hobby.
I wanted to "put down a marker" to date the introduction
of a new ham-radio innovation, and to officially place
the idea in the public domain, so the maximum amount of
"tinkering" with it can happen.

This concept uses the bandwidth available on the Internet
and some simple circuitry to create a replica of a segment of
the radio spectrum, stream it live or prerecorded to another

internet-connected computer and reconstruct that radio spectrum
at your location. *Any* radio equipment you wish to use
(given an Internet connection with sufficent bandwidth)-
from modern PSK-31 rigs, SSB nets, WW-II modulated oscillators
all the way back to ancient spark transmitters
with crystal receivers; all can legally communicate just as though
you were on-the-air. The system is bi-directional, allowing
QSOs between stations that normally could not communicate.
If you can't hear weak signals because of noise in your area,
the concept allows you to build a "remote front end" and
transport the radio spectrum in a quiet area right to your rig,
bypassing the problems in your location.

I believe this concept can be the answer to BPL, "noise holes,"
antenna restrictions, HF "jammers" and many other obstacles to
using our radios. There is great potential for many uses,
and a possible niche market for someone with the resources
to develop the equipment.
I have already built prototype equipment to prove the concept
and it works splendidly. The article includes construction
details. The circuits are simple and you can get
95% of the parts at Radio Shack.
By the time QST publishes (assume they accept the work),
we should have completed the first Virtual Spectrum QSO:
two World War 2 BC-611 handie-talkies (output: about 60 milliwatts)
will communicate over a path of about 2000 miles.

If QST does not publish the concept,
I will publish it myself on the web
immediatly after hearing from them.
I am indebted to Mike Hanz, aafradio@cox.net
for invaluable suggestions and encouragement.

I didn't buy my radios and build my stations so I could
let them gather dust while I "chat" on the internet.
I want *use* them.

I recall back in the early 70s how excited I was about the future of ham
radio via satellite and how I expected to see a flood of activity (that
never materilaized) to take us through the bad sunspot years.
Dave, maybe hooking up all those BAs thru transverters will be a better
answer.
:-)

```

I apologize for being a little vague about this. Are you proposing replacing wireless communication with wired communication (via the Internet) as a way to communicate with inadequate radio equipment?

"Wireless" doesn't always work, if you're in a "noise hole,"
or if the mode or radio you want to use isn't "legit" anymore.
So that's one use, yes.
The idea is to use our own radios as source and sink,
bypassing the vagaries of Mother Nature's propagation
and local noise sources. Or, if you're in a "noise hole,"
to bring spectrum to you from a "quiet" location.

It also allows the use of heretofore prohibitied modes.
For instance:
In the article I detail how an old longwave maritime
rig on 415 KC A2 can carry on a real-time CW QSO with
someone using a modern rig on 40 meters.
It will be a real boon for the "boatanchor" community.
I do hope QST will consider it.

Right!

I was excited about the microsats. Then they built this monster satellite
and spent millions on it. I don't know anyone in a 100 miles who uses it.

Just what would this internet communicating have to do with Ham Radio ?

Again, why would you need the ham equipment , considering you can do all the communicating to begin with just by being on the internet?

Not to be personally offensive (I mean it), but this sounds rather silly to me.

Ham Radio is communication over the airwaves using ham gear. Websurfing is connecting to other pc's and servers etc using the telephone line or cable, and the internet.

They both are FUN but they ain't the SAME !!

Dave, have fun. I'll check back to see how it went when I get back from the lake from fishing with my grandsons. And I'll be puttng my gear up for sale. If it doesn't sell, I'll take it fishing next time along with a good rope to tether the boat.

Greetings to all, please have a look, if it interests you to take part in an
experiment with Electric Thruster Ion Plasma Engine tests onboard the Space
Station.
The engine causes a VHF radio blackout on Earth and your help is need as
part of ground receiving network to map the extent of the effect.
Please go to
http://www.qsl.net/vk3ukf/etshoadowozindexqsl.html

There are links to more information at the Russian site.
You don't have to be an amateur radio operator, schools and S.W.L.'s are
also welcome.
Cheers, Kevin VK3UKF

[snip]

Dave, this is a fantastic idea. It opens up great possibilities for international co-operation between radio hams. When your spectrum in the USA is wiped out by BPL, we hams in the UK could lend you some of ours. I'm sure the ARRL and RSGB could negotiate an agreement, and sort out the reciprocal licensing issues.

Also, by the use of spectrum transformation, which you touched on in your follow-up posting, it would allow hams with restricted licences to experience propagation on bands on which they are not allowed to operate.

Yeah, I don't see the point either. There's a fellow near me (I'm
in Northern Virginia) who operates a remoted HF rig via the
Internet.

He calls it "Internet Radio". I honestly don't see the point of it.

news:Al2dnV5oibhI9RaiXTWJig@comcast.com...

> Just what would this internet communicating have to do with Ham Radio ?

It's another way for Internet junkies to undermine the hobby by attempting to blur the line between amateur radio and Internet communications.

The idea is to talk hams into being content to *pretend* that they are using radio when in fact they are stuck off in an elaborate Internet chat. These people get a big "charge" every time they hear that they have succeeded in talking a ham into going off the air, this way.

To these "Amateur Telephone" devotees, the hobby would be meaningless without the non-ham stuff. Packet/Internet gateways, EchoLink, you name it: As long as it takes hams off the air and puts them on the Internet instead, they are all for it, 100%.

Many of the most outspoken advocates of "Amateur Telephone" just happen to work for corporations that stand to gain financially if Hams lose spectrum. Isn't that special? An amazing coincidence, isn't it?

So it it really a bit early to tell, but all the signs point toward good old Dave Stinson AB5S being another "Amateur Telephone" idiot, out to denigrate and undercut the hobby with an offer to "help out" amateur radio with the Internet.

I guess it will be best to wait and see... And if good old Dave manages to denigrate and undercut the hobby with his new proposal, maybe we will get an opportunity to see if he can pick a telephone out of his ass.

Thanks for the paranoid hillbilly rant.
When BPL gets cranking, there won't *BE*
any hobby if we don't have a "work-around."
As for "picking things out of my ass,"
I'd like to start with your nose.
D.S.

Assuming that the intention is to allow multiple simultaneous users to independently tune around the band, the problem is the dynamic range (both in the analog RF front end and in the ADC) and high sample frequency required to transfer e.g. the whole 80 m or 2 m band over the internet. For the 2 m band, 5-10 MHz sampling rate is required, depending on region, and at least 16 bits/sample, so we are talking of data rates 160 Mbit/s, so even the 100baseT Ethernet is not sufficient to carry the signal, not to mention any ADSL connections.

And before anyone asks, no, you can not use (lossy) compression, since this would prevent decoding some of the signals at the user site.

However, a linear satellite transponder has a quite limited dynamic range and a modest bandwidth, so the requirement are far less demanding.

>The system is bi-directional, allowing
>QSOs between stations that normally could not communicate.

It does not make much sense to transfer the whole frequency band to the transmitter. It is much simpler to use a remotely controlled transmitter for each user at some separate location (far away from the receiving site to avoid blocking) and only transfer the base band over the internet.

>If you can't hear weak signals because of noise in your area,
>the concept allows you to build a "remote front end" and
>transport the radio spectrum in a quiet area right to your rig,
>bypassing the problems in your location.
>
>I believe this concept can be the answer to BPL,

If the reason is simply to avoid the local noise problems due to BPL/PLT/PLC and other electric interference when receiving, the transmitter is not affected by the power lines (carrying BPL) running parallel with your transmitter antenna, so why not simply run the transmitter manually from home and monitoring the band using a remote receiver at a quiet rural site.

However, it might not be a good idea to use the BPL to carry the signal from the remote receiver, since the BPL might be blocked during your transmissions and you could not run QSK :-(, which otherwise would be possible using a remote receiver site.

Don't worry about BPL. The ARRL, as with Morse Code, is making
a mountain out of a mole hill. If the military isn't worried about its HF
assets, why should Hams be worried?

I never said anything about transferring the entire band.
At this early stage, I'm only talking about streaming
about 25 KC of any band at any one time.
I'm limiting it so people can use the hardware they already have.
But the concept is "scalable" to larger bandwidths.

> If the reason is simply to avoid the local noise problems due to
> BPL/PLT/PLC...why not simply run the
> transmitter manually from home and monitoring the band using a remote
> receiver at a quiet rural site...

Avoiding BPL is only one aspect of very many.

I guess I wasn't clear-
For those who like Echo Link and what the rude Mr. Blabham
calls "Amateur Telephone," please have at it. Enjoy.
But frankly, I don't give two cents for using an
Internet chat room to talk over *someone else's* radio.

I restore ancient and military radios to original condition
and I want to talk on *them.* Some of them aren't even
capable of being used on ham bands. You'd be surprised;
there's a lot of us out here. With this system, like minded
people can use these radios to QSO completely legally.
If we wanted, we could have a real spark-gap to spark-gap QSO
with crystal detector receivers- in fact,
a whole bunch of such stations in a net-
because we are literally on our own, private ether.

Here's another:
I live in an apartment; I can't have an antenna.
My neighbors have strict restrictions; they can't have outside antennas.
If I use this system, I don't NEED an antenna.
Nor do I need a big, power-hungry amplifier.

Here's another (For Peter's sake):
I love listening to shortwave radio. The power
company installs BPL, and now all my carefully-tended radio
will say to me is: "BSSSSSSSSSSSSSSSSSRRRRRRRRRRRRRRPPPPPP!!"
Do I give up, put my favorite radio on the shelf and listen
to them on the Internet "phone?" Hell, no.
I log into a server that's streaming the 31 meter band in chunks
of 25 KC from a quiet location in Itchyarmpit, Idaho.
I pipe that into my V.S. transverter and into the antenna
connection of my radio. Once again I have evenings of
enjoyment listening to Radio Gabbabootoo.

If I want to hear Radio Binga Boinga
and the five other stations around that frequency,
I select the correct stream and enjoy.

I'm not an electronics engineer, guys- just a tinkerer like most of you.
I don't know "47th Order IMD products" from beans,
nor do I know all your wonderful engineering reasons why it won't work.
All I know is I built the simple circuits and it DOES work.
The fact that it's still crude is actually a big plus,
since it opens a new field in which the average,
none-genius amateur can do some meaningful work,
and that's something we haven't had in awhile.

The point is we are using our radios, not a blasted telephone.
And I'll say it again: When BPL is activated, if we don't have
a "work-around," there won't BE a hobby.

There's a quote out there somewhere that says any
new idea will always be met with nay-sayers and
hecklers. That's fine- comes with the territory.

says...

<big snip>

> Don't worry about BPL. The ARRL, as with Morse Code, is making
> a mountain out of a mole hill. If the military isn't worried about its HF
> assets, why should Hams be worried?

And how, exactly, do we know the military ISN'T worried about this?

Common sense alone would dictate that no military source in its right mind would come out openly opposed to BPL. That'd be no different from putting up a big billboard saying "To Jam US Military Communications, Simply Switch On BPL" or something similar.

There are already some heavy hitters (ARINC for one -- or didn't you know that commercial aircraft flying overseas routes make broad use of HF?) fighting BPL deployment because it does indeed interfere with their equipment. That creates more than an annoyance, especially in ARINC's case -- it becomes a safety issue.

I'm waiting and watching on the whole affair. I don't think anyone will know for certain how bad things are going to get until BPL starts to go into deployment. Once the military, and other commercial HF/VHF-using services, see how much noise they get from power grids so equipped, I predict it'll get shut down quicker than you can say 'Marconi.'

I wondered that myself. Take note that it's already been done.

Back in the sixties, there were a number of pseudo-academic articles that appeared in CQ in the April issue, I think under the same pseudonym. There was one about using phone lines for amateur radio, complete with "DXpeditions" to exotic countries. It was voice, but it had an odd similarity to the internet. I can't remember, though, if this was in the early sixties, my guess 1964, or the late sixties, likely 1968. It's not like therre were a lot of April issues in that decade, so someone with a complete set (and in order) could check. They threw in some archive photos, and plenty of official sounding titles and committee names, so it came across really well (unless you got suckered).

Actually, Dave, something like this idea was proposed by George Gilder back when "TV over the Internet" was a hot topic.

Gilder proposed that the Internet providers simply bring a fiber-optic cable to one's doorstep and stop there. The fiber would be "dark". But any light you launched into it would come out the ends of all the other "dark" fibers - all over the world. In effect, the Internet would become an extremely wideband virtual ionosphere for optical waves. And, of course, at optical wavelengths, there are huge frequecy bandwidths available, so everybody could have their own TV channel, or ham band, or whatever. The trick would be that you had to provide your own optical terminal equipment to interface to the fiber.

The point is, your scheme isn't as far-fetched as it at first sounds. I still like the "old-fashioned" iononsphere for radio propagation. But your observation about the increasing number of restrictions and interference sources amateur operators are encountering in pursuit of their avocation is quite relevant to the current state of affairs.

David,

Your idea is certainly technically feasible, and would provide a way for folks to continue to 'use' obsolete radio equipment in a post-BPL era. Similar in many ways to the micro AM transmitter that I use to broadcast old-time radio programs to my antique radios, for demonstration purposes.

Somehow, though, it wouldn't be the same. DX-ing and shortwave listening are, for me, pursuits which are made interesting by the sheer randomness of long distance radio communication. Things like building a better antenna or tuner, or waiting for the window to open to that country in order to catch an elusive transmission - that's where the fun is!

Internet communications, however, are carried over the same high-reliability global networks as telephone calls. From my keyboard, I can DXCC in probably under half an hour - which would be a very unfulfilling task, given the certainty of the medium. And that's why I have no interest in some of the existing Internet/Amateur Radio interfaces, such as IRLP - sure, I can talk to some guy over in England on my 5 watt 2-meter HT using a local repeater and dialling an access code to his local repeater - but it isn't DX, its more like a telephone call to a random party at the destination over the Internet. More like using VOIP to call a pay phone in England, then talking to whomever answers. To me, that ain't radio. It's a phone call.

Nothing more.

Your proposed interface would provide a way to simulate real QSOs on the old equipment - but it would not be 'real'. Not much different, really, than building a Telco interface for the radio, dialling up the far end, and pretending to have a radio QSO using the mike and speaker instead of the handset. A radio simulator of sorts, with a real boatanchor configured like a speakerphone at each end - but just a simulation nevertheless. Not a true radio QSO. I could wire up my electric pencil sharpener with a mike and speaker, and establish a QSO over the Net with somebody on an ARC-5.   That don't make it a radio, though!.....but it would look kinda cool ;)

Some will find this interface quite acceptable - if conversation with others is what the hobby is about for them, this will provide a nostalgic way to continue to QSO with familiar radio equipment. 'Whatever floats their boat'.

For those of us who chase DX and foreign broadcasts through the ether or thrive on overcoming technical obstacles, however, I suspect that our interest would not be held for long by such an interface. Just like piping 1941 Jack Benny programs to my AK-55 - cute, but it doesn't make it seem like it's 1941. Great for demonstrating the set to guests, though - after half a minute or so, their interest is dissipating and the AK is switched back off.

If BPL becomes a reality, my HF gear will be going up on the shelf with the other old radio equipment - to make room for the satellite and moonbounce equipment that will take its place.

YMMV, of course...

73, Leo

Not mine. Not if I can possibly help it.
I can't stop BPL, but I *can* get around it.
And what I'm proposing does not preclude what you want.
Let's say BPL does come to your area, and
all HF sounds like a buzz saw.
In your case, you still have your transmitter there at your house.
You use a remote front end, and stream the portion of the DX band
you want to work from a friend's house out in the quiet country.
The only difference is that your receiver is effectively offset in
location
by a few miles. That isn't going to make finding that weak
DXpedition any less challenging, but it *will* make it possible.
Otherwise, it's give up the ship entirely. There's no need
to give up your enjoyment; You just have to be a little flexible
to work around the problems these numbskulls throw at us.
Afterall- haven't we hams been doing that for a century?
73 Dave S.

Sounds like a perfect article for this coming April's edition of QST
to me :-)

Seriously - you can't be seriously suggesting that vulnerable infrastructure
be considered as a viable replacement for infrastructureless HF
communications?

Again ... perhaps in the April (fools) edition of QST ...

With a less pompous start, you might have gotten some more favourable comments :-).

The problems with high noise levels is of course real for many radio amateurs and shortwave listeners living in urban areas.

For a few years there have been remotely connected receivers connected to the internet which can be remotely tuned to any desired frequency and the audio is transferred over the net. The problem is that only one user at a time can control the receiver.

However, in order to create a shared receiving station in some quiet location without huge hardware duplication for each user, would require that entire bands are digitised (with dynamic range problems) and the whole band is then transferred to each user. Some DSP software running in each end user computer would then do the filtering and detection. If some kind of multicasting is used from the receiving site, this would give an unlimited number of shared user for each band.

The other approach would be to digitise the whole band and run multiple virtual receivers in software, individually controlled by the remote user, producing a baseband signal, which is then transferred to the user. The number of simultaneous users would be limited by the number of virtual receivers (limited by the hardware computational power) and the throughput of the shared receiving station internet connection, requiring 10-100 kbit/s for each active user.

A shared remote receiving station is not very compatible with transmitters on the same site, so the users would have to use their transmitters at home or pool a number of transmitters on a separate transmitter site, at least a few kilometers from the receiving site.

Of course the simplest, but not always the most cost effective solution is to have a summer cottage with a broadband connection in some quiet rural location. Move your station to the cottage and when not at the cottage, connect a remotely controllable transceiver to a computer (audio in and out, serial data and PTT) and control the station from your urban home. A remotely controlled antenna rotator also helps a lot. In this way you do not have to suffer from noise, antenna restrictions and neighbours complaining about interference:-). Using some watchdog timers is a good idea, in case the computer or internet connection crashes.

I certainly don't mean to be pompous, at least on this matter.
I've tried to make clear in the body of the post that
I'm not the brightest candle on the cake, that I
want to get the idea out so people with more talent
than me can work with it.
As for the unkind comments of a few:
Hecklers, cynics and naysayers greet anyone who proposes something new.
It comes with the territory.

> For a few years there have been remotely connected receivers connected
> to the internet which can be remotely tuned to any desired frequency..

Yes, Yes... Am I just not being clear, or are people not
closely reading that to which they reply? Probably a little of both.

We don't WANT to talk over an Internet telephone line
to some remote base station.

That's not the point.
Please read it again:
That's NOT the point. < (repeat as necessary)

We want to *use our own equipment, right here.*
Noise, antenna bans and LEGAL restrictions
have kept us from the work we want to do.
This system gets around the obstacles by creating
a second "ether" (ionosphere, etc.; pick the term you like)
which you control and *you* regulate.
The two main points are:

1. To make possible radio operations of any kind that
   were once impossible, for any number of reasons.

2. To "harvest" clean spectrum in a quiet location and
   bring it to your receiver, so you can continue
   your radio hobby regardless of what BPL or any
   other interferance source does to your local radio environment.

The system is intentionally simple and limited,
so lots of people can tinker with it in short order.
I have faith that those many people
who are sharper than me will expand the concept.

I've had a heck of a lot of fun working on this.
Especially enjoy the ability to record radio spectrum.
I have one hour-long segment on CD centered on 3932 KC.
It contains seven separate, distinct and interesting SSB QSOs
that I can listen to at my leisure, plus many other stations.
And a lot of us military radio people think having a
nation-wide net of WWII BC-611 handie-talkies,
all able to talk to each other in real time,
would be an absolute gas.

Here's something cool: I've long been involved in longwave
work on the 1750 meter band (160-190 KC). This winter,
I plan to take a laptop and a V.S. remote front-end
to several locations and record an hour or so of the band
from 170 to 190 KC. I can then take them home, run
the recordings through a V.S. transverter, and hunt for
all those weak LOWFER signals in the comfort of my own home.
It's still just as challenging to find them, but I get some
major advantages. First, I'm not off on frequency "A" and
missing an opening to station "B;" I can "rewind" and go
look for him, too. Second, I'm not sitting in the dark,

freezing and trying to tune my audio filters with numb hands.

Anyway- it's a tool people can use if they want.

Just because you can hear a station at a quiet remote location doesn't mean that they are going to hear you when you transmit from your location. Shouldn't the transmitter and receiver be at the same place?. It still doesn't guaranty that you will be heard but it gives you a chance. Propagation is dependant on geography and geology too, I think, no?

Wouldn't it be more simple just to hook up all of your ham gear to a telephone line, and pretend that you are hamming via the telephone ?

Seems a much more simple approach to me, and the same outcome-- you would be **using**   (hee hee hee) ham equipment, while talking on the phone !!!

Hi folks happy to announce that MixW version 2.10 now is posted on our websites.. for downloading this version will replace version 2.09. The bug in 2.09 has been fixed and this version also has hundreds of Flag Icons from all the nations of the world including the islands of the carribean.. The website for downloads is: www.nvbb.net/~jaffejim/mixwpage.htm good luck and Happy Warbling.. Jim, WA2VOS MixW Software USA

I need to stream *live* audio and recover it with flat response
from 200 hz to 20 Khz (soundcard; most will do 20KC).
I have a broadband connection.
Can some of you computer gurus recommend a system?
Thanks.

They don't.

If you have a PTC data controller then take a look at kptc.
It's a KDE (X-windows) client to drive a PTC in just the way that you want.

You can find it at: http://kptc.sourceforge.net/

I found it by looking at: http://radio.linux.org.au/

regards
Terry

Jim,

We have a complete line of accessories for the PK-232, including the manual
```

(copyright) and terminated cables to match the PK-232 connectors. Please check our website, http://www.timewave.com, for more details.

rplay and rplayd maybe? (Linux) Maybe some of the Netmeeting/Open H323 type systems? Pretty sure their codecs tend to limit to voice bandwidth only. (ohphone is a GNU H323 for both Windoze and Linux. You may be able to mod the source code for wider bandwidth) (Not online but I'd try a google on - "streaming audio daemon broadcast quality" - not in inverted commas of course)

I'd think the big problem in bandwidth response is going to be the characteristsics of the soundcards themsleves. If its a dedicated link you could certainly play with the input/output in DSP or analogue. Shove some wideband calibrated noise in one end and spec-an the other and process accordingly. I hope group and phase delays wont be a problem?

There are some better than "usual" soundcards out there (eg 96khz vs 44khz sampling rates and better freq response) that would do a better job. (and drain the wallet more to!)

Never tried it but under Linux you may able to address a device (sound card) on another machine directly. (I mean you can do it with tape drives...) Wouldnt be very nice about codec/compression etc.

I'd think that a soundcard line in/mic might have a cutoff at maybe 10kHz but I've never checked. A mod to the card maybe?

Keep in mind that with transporting sound over IP van be lossy, ie packets gets dropped. Most systems use UDP rather than TCP so the packets arent acknowldedged and therefore arent retried. If a perfect system is needed you are going to have to put in some delay to give the circuit time to retry for lost packets.

Hope this helps!

Cheres Bob VK2YQA

May be you shoukd look at Ogg Vorbis. http://www.xiph.org/ogg/vorbis/

It's a patent-free audio coding system, which matches/rivals the quality
of MP3 and is also streamable. Ogg is an IETF standard and lots of free
players are availsble.

Hope this helps.

Hey, if it's just closed to whining Linux dweebs, what's the problem?
Thousands of hams think it's a great deal. I haven't seen any evidence that
the Linux folks are missed.... Not at all!

;-)     Just yanking your chain. It's written for "Winders" because that's
what over 90% of all hams use. The guy could have written it for Linux too,
but then he'd feel obligated to write it for the C-64, the Amiga, the Mac,
and all the other third-weenie stuff. If you do it for one odball system,
they expect you to do it for them all, so the author drew the line at
"Winders".

Exactly what does echolink and the internet have to do with ham radio ?

Yes, most of the users of echolink may be hams, but they are using the internet to communicate, not ham radio.   I am sure that is fun to some folks, but it is far removed from ham radio !!

As I type this message, I am using the internet. Many hams will see this message. But I   AIN'T   Hamming !!!!!!!!

Just my opinion.............   no flames please !!

Same argument about the phone patch.  It's not ham radio, it's
the telephone.  Give me a repeater with a phone patch, and I'll
show you a bunch of appliance operators.

You wouldn't know what to do with it anyway. Go get a copy of
Speak Freely, and you'll have 80% of echolink software.

http://www.speakfreely.org/

If you need source code for all of your software before you think
you can safely run it, then get linux.

- ah! but here's the point: if it were open source, the 'guy' wouldn't
  have to write it for those other platforms - and the app would be
  better, more secure, etc.

- but hey, i recognize that a proprietary software product is just that -
  proprietary... i do have to credit the source for making it free...

- i'll just wait for the open-source version... i doubt the protocols
  are intellectual property...

```

That's why it wasn't written open source. It's a "Winders" program.

I suppose the author must think that those open-source programmers are so skillful and productuive that they would finish it up before he possibly could, so he didn't worry about those oddball platforms that hardly anybody uses. The open-source guys have probably already written it by now anyway, but we just haven't heard about it yet. Yeah, I bet that's it.   Yep. - And it will port right over to my Commode C64. You betcha!

I think that you are absolutely right.

I was disgusted to hear about the ARRL president getting on that hokey setup
and pretending to be operating as a ham. - Honoring the 9-11 victims *as a
ham* by getting on a non-ham setup that would be guaranteed to go dead
during any emergency precisely because it is based on non-ham stuff. Why
couldn't the guy get on W1AW and actually use radio? Is utilizing a non-ham
setup that is no good for emergency communications really an appropriate way
to honor the memory of those people *as a ham*? I don't think so. Instead, I
wonder what kind of message he was sending when he turned to the non-ham
stuff to communicate with other hams *as a ham*. I think the man should be
ashamed of himself.

Oh whine whine whine I feel Soooo left out!
You did not even mention CP/M nor Atari 400/800.
How could you do SUCH a disservice to those venerable
systems which (along with the TRS-80) got packet radio going?

But echolink is not ham radio, so who cares?

A phone patch does the exact OPPOSITE of echolink.

I'm a no-good knuckle-dragging no-coder, as the tech-class is referred to on these groups. I've had my license for exactly a month now, and I'm starting to explore some of the interesting modes one can work with a PC sound card. I have the speaker output of my rig linked to the line-in on a dedicated pc via an isolation transformer, and today I tuned around until I found some packet activity. It was not at all what I would have expected. People weren't really communicating, as much as broadcasting the same line of text over and over again. Several were just sending NMEA data (not actual APRS packets), presumably for some kind of position reporting system. There seems to be about four times as many people on that one packet channel as there are on voice throughout the entire 2-meter band.

Could someone:
Give me a brief intro to the procedures, protocol and etiquette of packet radio?
Explain how contacts are made and confirmed?
Recommend frequencies/times to join in, and software to use (right now I'm using UISS)

Thanks, and please don't flame me-- I promise I'll upgrade to general soon!

kshowmail shows the headers of mail on the server and
```

lets you delete them without downloading... Not that
I care for viruses, don't hurt me anyway, but I don't
want to wait while downloading that crap.
Microsoft really shouldn't be allowed to sell software
(or rather force people into buying by preinstalling on
everything, its not easy to evade that ms tax if you buy
a new computer system).

Per, sm0rwo

You think YOU have it bad?
I have received 1,254 messages containing the same virus in the last 24 hours... compared to a usual of 5 messages a day total. Now THAT sucks! I am going to have to remove this e-mail address from my domain if it doesn't stop soon.

You think YOU have it bad?
I have received 1,254 messages containing the same virus in the last 24
hours... compared to a usual of 5 messages a day total. Now THAT sucks! I am
going to have to remove this e-mail address from my domain if it doesn't
stop soon.

Any thoughts on the AOR digital voice modem?

Sounds pretty interesting. Haven't seen one cheaper than $499 though.

4382 virii currently quarantined in Postini for my benefit... 20 have sneaked through and been gutshot by Snortin' Futilities Antivirus... have already deleted 1500 virii friday and saturday and gave up to see what the count rises to. so we're around 5600 for the weakend.

and there were folks at my home ISP who had 4800 by noon saturday.

clearly these script kiddies are not very clever... they could have directed all this excitement to, say, whitehouse.gov or verisign.com, and done something useful. or to microsoft.com, where by rights they really belong :(

My Unix gSnot devaluator doesn't recognize those terms and they all came
up in Chinese characters on my mailreader after it enountered the fact
that you actually COUNTED 4382 virii.
Might you have a set of Dymo labels in this language that I can tape
onto my computer box? Red would look best.

```

First I want to explain why this is urgent:

I want to file a comment on PLC/BPL to the EU Commission
(see http://tinyurl.com/lmm3 and http://tinyurl/nkt0 , if
you live in the EU, you should file one too) and the deadline
is on 1st of October. So I really would like to have this
information as quick as possible!

What I am wondering is if the Garmin Rino

http://www.garmin.com/products/rino/

has directly or indirectly been influenced by APRS, or
if otherwise it could be said, that amateur radio has
led to or enabled the creation of this product.

Background: I want to argue that amateur radio not only
carries out purely technical experimentation, but also
experimentation into usage models and patterns, which can
lead to commercial products and business models. IMHO
this is a good argument for ham radio, especially in
europe, where wireless companies are hurting from dot.com-
style bidding-sprees for 3G frequencies/licenses, and no business
models or uses for these services are to be seen.

If you've got similar examples in recent times, I would
be interested in these too.

Thanks in advance! I will post a pointer to my text after filing.

Depends on what you are trying to accomplish. At higher bit rates, Ogg
Vorbis seems quite good. At all bit rates, MP3 is the most compatible with
different hw/os. There was a recent review of encoding schemes referenced
on Slashdot.

This is the long awaited followup to the USPN Flex32 tutorial, and guides you through the setup of the excellent Paxon terminal software that works so well with Flex32.

Sorry I was so slow!

The web-site, installer program and help files for Paxon are all in German, but the program comes up in English. This new tutorial will guide you through the web-site and installation process, leaving you after your first packet connection with Flex32 and Paxon.

Flex32 and Paxon are great for many varieties of packet, including regular old AX25 at 1200 baud of course, but many hams are not aware of the fact that Flex32 and Paxon will get you on HF too, in the new Q15x25 mode, called "Newqpsk" in the Flex32 control panel's drivers list.

Q15x25 mode uses 15 psk streams at 88 baud each for an effective 2500 baud on HF. It is a wide-mode, similar to PACTOR III in this respect. It acts a lot like packet, but with more throughput of course. Q15x25 enthusiasts often swap JPEG pictures, since Q15x25 has excellent error-correction.

The new Paxon tutorial can be found in the "Tutorials" page at USPN:
http://www.uspacket.net

Please let me know about any mistakes, ambiguities or omissions; I just hacked it out this morning!

Any station can be picked up, even if they don't have a computer!

If you send $50.00 to my email address via paypal, I'll even show you
how to do it!

In response to your first question: Yes, IF the computer in question has the appropriate hardware (a receiver card, or similar computer-driven radio) and software (drivers for said card or receiver) installed. In short, you need to have a special radio receiver designed to be installed in, or controlled by, a computer.

In response to your second question: If the station in question is streaming its audio to the Internet, you need only use the appropriate media player software installed on your system.

Hello, All!

I have uploaded SeaTTY 1.23 beta to the main site and mirror:

http://www.dxsoft.com/seattyb.zip
http://www.hamport.com/seattyb.zip

On this week you can purchase SeaTTY reg-code with 20% discount there:

http://secure.emetrix.com/order/product.asp?PID=23181337&DC=sea28

===

SeaTTY versions history

V1.23
AFC has two parameters now.
The first parameter is local deviation in hertzs, i.e. maximal deviation

from current frequency. Second parameter is global deviation in hertzs,
i.e. maximal deviation from last user-selected frequency. User-selected
frequencies are shown at spectrogram by short red lines .
V1.22
A problem with FAX synchronization losing while image scrolling was fixed.
If start tone is found during image receiving, SeaTTY saves image and
startsnew image receiving now.
V1.21
RTTY and NAVTEX decoders were rewritten.
Decoding quality was vastly improved.

Hi just an update to say that I have added more softwares to my pages for
those who are interested in any data mode using a PC soundcard.

www.g3vfp.org/download.html

Call in and enjoy :-)

Cheers,

Dave G3VFP

I have a PK232MBX for sale. This unit has been sitting in storage for a couple of years. I am the original owner and I have added the DSP daughterboard. I will ship with the original manual (in grey plastic binder), DSP addendum, cable to connect to PC and original box.

Note: There are some scratches on the top of the unit and it was working the last time it was powered up approx. 18 mos. ago.

Asking $100.00 or best offer.

Please email off list if interested, and thank you for your time.

I have a SignaLink SL-1 for sale that has only been used to decode, never transmitt. It is in excellent condition and comes with an un-terminated connector (RJ45 on one end, open on the other), jumper wires, the original manual and original box.

Asking $30.00, you ship.

Please contact me off list if interested.

Open the KPC3 and look at the Eprom it will have the version number (V5)
(V6) (V8.2), you need V6 or better to run GPS NMEA interface capability.
You should be able to find someone with an Eprom burner and upgrade the
Eprom to the latest version (from the Kantronics website) if yours is not V6
or better.

You ARE using two radios, right? (You only mention ONE in your post)

What type of antennas are you using, and how far apart are they?

Have you looked at the signal getting into the MX614 from the
receiving radio on an oscilloscope? If so, what does it look like?
If not, then I suggest you start there, and tell us what the signal
looks like (as compared to the transmitted signal).

According to the Kantronics website the laters firmware for the KPC3+ is
version 9.0. I was unable to locate the Eprom data to burn one myself.
It looks like the only option is to buy the Eprom from Kantronics
($59.95).
As fas as I know you need at least V8.2 if you want to run the KPC3 as
autonomous APRS station (without PC).

This sounds interesting. I assume you run the output of a receiver into the line in of a sound card on a pc and the software produces modified output thrpough the pc's speakers ?

If your interest is strictly IRC, it's technically pretty simple to do what you want, although there is some work involved.

Someone indicated "at least" 9600 baud, as you are probably aware, this is overkill if your interest is IRC. 1200 is plenty, and you probably could get by with 300. Obviously, this is way too slow if you want to surf the web.

Here's the deal, though. Let's say you have a laptop running something like MixW, which would allow you to connect the laptop's sound card to your transceiver and do packet. This is simple and portable and a lot of people do it regularly.

Back home (and the assumption here is that you are operating within radio range of home), you have similar software or a TNC connecting your home computer to a radio at home, and then, you have some sort of software interface to connect the packet client to your IRC client.

The "some sort of software interface" is the catch. If you have a TNC at home ($$), then this could be relatively simple, providing you are reasonably adept at PC programming. But if you want to run a software TNC, this could get to be a real pain.

The other issue to keep in mind is the range. Packet is clean and simple on VHF FM, but these bands have basically line of sight range. Now, that's not quite as bad as it sounds, 25 miles is pretty reasonable with a decent antenna at one end, and depending on your geography and how much you want to invest in antennas, even 100 miles is not out of the question for reliable communications.

HF is anther can of worms entirely. HF packet is basically worldwide, but it's really messy business and anything but reliable. It's pretty interesting that if you are camping relatively close to home, say 50 to 150 miles, it can be very difficult in the summer, just when you are likely to be camping. In any case, it doesn't seem like an unattended base would be very easy to make reliable, and the antennas could pose a challenge on the camping end.

If your interest isn't exactly a particular IRC channel, you could consider

PSK-31. This is a mode a lot of folks operate portable using a PC and a transceiver. it is very IRC like in operation, although instead of named channels there are simply places on the screen (!) and it tends to be more one on one rather than groups. Still, the flavor is much like IRC.

PSK-31 tends to be used on HF more than VHF, which you may realize requires a somewhat harder license.

While I didn't like Rob's "you can't" answer, since it seemed like he never really read the question, his answer may be pretty close to correct for practical purposes.

Keith implied a somewhat different approach, probably easiest with 2 machines running Linux. Basically, you have an 802 connection between your laptop and your home PC which is presumably connected to the Internet. By running routing software at home, the laptop becomes joined over the radio to your home network and has all the capabilities of a connected computer.

Because ham radio is non-commercial, however, and because so much stuff on the Internet is commercial, you would be challenged to keep the oepration of this sort of connection within the law. That problem isn't nerely as severe if your target is purely IRC.

..

Don't waste your time or money. The Ham Radio hobby is for people who have a genuine interest in radio. It is not a communications carrier or a back door to getting freebee services. Generally, the "freebee" services ham radio provide require a substantial investment in both personal time and money in order to exist or to be utilized. If you don't have a particular interest in radio, you will find that ham radio is ultimately unsatisfying. You have to learn a bunch of stuff, work cooperatively with other people, follow and respect not only the FCC rules but ham radio's "gentlemen's agreements" as well. Many people will expect you to show an interest in community service.

You have made it plain that your interest in ham radio only goes as far as what kind of "freebee" it might give you... That's not really a good enough reason to go through the effort. You'd be better off without ham radio, and ham radio would be better off without you.

I'd say your best bet is to go with plan "B"; something that does not involve ham radio.

Charles, N5PVL

In article <K7u1b.48$E33.54370@news.uswest.net>, MRQuickBoard says...

> That is why i am asking if it can be done if it cannot be done then i wont
> do it and stay away from ham radio. don't want to waste my money getting a
> license or the time to study if it cannot be done.

It's not a question of whether it CAN be done. In the technical sense, of course it can. The question is whether what you want to do is applicable to the real purposes of the amateur radio service.

I will add that getting wireless access to the Internet is not why the service exists. You would know this if you had taken the time to do some basic research with Part 97 of the FCC regs, or visited ARRL.org and read 'The Amateur's Code.'

If you don't like the thought of helping to serve the real purposes of amateur radio (helping with disaster and other emergency communications, teaching a ham radio class, developing the skills and acquiring the tools necessary to tinker with radio and related electronic hardware, etc.), then you would be well advised to steer clear of the amateur service.

In short: If all you really want is wireless Internet access, pop down to your local CompUSA or whoever, and pick up the hardware to do it. Anyone who wants to can buy it, no license required.

There is a new radio by ICOM called D-Star that suppost to let you do this.
I'm not sure of the FCC rules but ICOM's website is a good place to start. I
understand it cost about $1400.00 and works at 1.2G so it's costly for what
yo are looking for.

Sure you can. (With a Tech or better Amateur License of course.)   I use Jabber, FreeAgent and POP for Email from a Windows 98 systerm, through a Linux router to a Linux gateway. All are relatively low traffic systems and work adequately even at a mere 1200 baud.   A couple other postings here had some good details on how to do it.

Very good point about commercial content in web pages.

To the original question: Does it have to be Internet chat or can't you simply use the digital communication modes that already abound? That would be simpler, provide more options and probably much more reliable.

For the sake of conversation, how much would the option to view a webpage in text-only filter commercial content (i.e. pop ups, banners, etc.)? The topic is fairly common among folks interested in ham radio. Or, is the only true solution to filter, edit and make available certain html pages from a stand alone server via a club station's ham radio?

Its an individual decision, I suppose. Personally, I would not trust my liscense to a web-page I did not personally control, and I would be uncertain of the security of your average web-server. One that I work with was hit twice this year by "terrorist" hackers, one instance affecting over 1000 domains.

So I would go with your last option, html from a stand alone server via a club station's ham radio. - But that's just me! I'm not telling anybody else what to do.

HTML and packet radio are naturals that go together well. If each user has a store of standard graphics on their hard-drives in a special cache, you can do some pretty attractive HTML without ever having to transmit graphic files, just HTML text. This makes it go reasonably fast, even over 1200 baud links. In the pre-Internet days, the Prodigy network used to do something like that in order to speed up the service and still have nice graphics. There's no reason hams can't do the same thing.

Charles,
Of course the idea of filtering anything off the web was just brainstorming and I'd never put my callsign behind anything like it either. Thanks for not lighting a match at the utterance of the E-word on a ham NG. I'm just rambling outside the box.

For the Group: Is it plausible to pass data through a repeater above or below voice just like the subaudible tones?

Bill,

He specifically asked about Internet Relay Chat, which afaik isn't available.

Dunno ... works from here ... over Ham Radio tcp/ip links,
were one to actually want to do that :-) Choice of several
Ham Radio to internet links ... but who would bother?

I thought people went camping/fishing/etc. to get
away from it all. I guess I'm mistaken...

Hi,

Well, getting a ham license isn't exactly a waste of time, but it does carry some responsibilities. Unfortunately for us, one of them is abiding by communications law.

Currently, governments like to be able to trace directly where communications on their system originate. It has to do with law enforcement mainly. Hams in the US have been able to do email via the internet for a while, and it is regarded here in Australia as "allowable" for licensed hams providing they don't have direct access to the 'net.

I think such services, if allowed, would be swamped fairly quickly with illegal operators anyhow (remember how CB got going?). And someone still has to pay for the fixed station bandwidth, both on air and cable. If it ever comes to pass, be assured that the government will charge heavily for the right to monopolise a static frequency.

Rob

Sure it is. It's just another Internet application.   That's part of
the magic.   It's a relatively low bandwidth application very much
like Jabber. Any TCP/IP application will work as long as it doesn't
exceed the bandwidth available.

73,
Bill

I do not consider our obligation as hams to abide by communications law to be "unfortunate"... It strikes me as being essential and beneficial, in no way unfortunate because without that obligation we would quickly go the way of CB, as you say.

People who work to undermine these rules and our obligation to follow them as hams are directly attacking the hobby, attempting to undercut the basis of our legitimacy. Most often, these attacks are based on a stated desire to obtain a "freebee" at other's expense.

Don't let these folks discourage you. If you don't want to put up with a bunch of naysaying hams, look into going the licenseless route with MURS. MURS allows digital communications, up to 2W transmitter power, and best of all, gain antennas (so you can construct communications links having fairly decent comm range).

For more information on MURS:
http://groups.yahoo.com/group/MURS-OPEN

Again, I respect you interest in radios, and your application, and depending on your application you may be able to get by without directly messing with ham radio... although, if you catch the radio bug, you may find you want to get a ham license after all.

Again, don't let these folks discourage you.

It is possible, but you asked the right question - is it PLAUSIBLE?
In other words, does it make useful or economic sense for your
application?

What useful information would you be sending while you were talking?

Are you willing to come up with your own modem design? (as I doubt if
there are any "off-the-shelf" designs you are going to be able to use)

What is the smallest commerically availible APRS Tx?
I want to use it in an RC plane.

Has anyone homebrewed a smaller one?

Stuff that's faster, easier, and more accurate to type/read rather than it is to speak/hear! Lots of stuff like that. Get briefed on the basic situation while the detailed data uploads.

If somebody comes up with a subaudible tone data system, even at a low data rate, I'd like to hear about it.

The question about sending data using subaudible tones reminded me of a quick 'n dirty soundcard digital setup I found for use over voice repeaters. You can't talk while its working, but it does allow you to go back 'n forth between voice and data. There are probably times when that would be useful.

I was playing around with FlexNet's Flex32 version of Q15x25 mode, called "newqpsk". This mode is intended for HF, and uses fifteen 88.3 baud PSK streams to give you an effective 2500 baud. I decided to try it out on VHF, then decided to try bumping the TXDELAY up around 500-600 MS and see if it would work over the local voice repeater, connecting to another VHF newqpsk station in town on that frequency.

It worked very well! I was at home, and my friend had a laptop in his truck across town. We were able to do all the regular digital stuff. Newqpsk is a lot like packet to use, but of course sounds very different. You can send binary files with it, because it has error correction like packet.

The easiest way to check out newqpsk in Flex32 is to see the "Soundcard Packet" tutorial at USPN, that describes the setup of Flex32 for 1200 baud afsk packet. On the part where you choose afsk for the soundmodem from a dropdown menu, just go down to the bottom of the list and choose newqpsk instead. That's the main difference between setting Flex32 up for newqpsk instead of packet. When reading the tutorial, don't miss the part at the last where it recommends the PAXON terminal program. You'll be glad you did, PAXON is really nice.

This is not bad; A 2500 baud digital setup that can be used anywhere there is a voice repeater. The high TXDELAY introduces some slowup, but overall it's fairly snappy. - Good enough to get some lengthy or involved text sent across, or perhaps a small binary file like a JPEG. Since it's a soundcard mode, it's very portable and the price is right too. (free)

Note: The MixW Q15x25 dll package sets you up with an interleave of 16. To make the Flex32 newqpsk version compatible on the air with MixW stations, bump its interleave up to 16 as well.

I'm not sure if think this is quite right as far as Australian law is concerned. There is no limitations on connections to the internet so long as the ham at the internet connection passes that information on as third party traffic (similar to phone patches) and that the information is not of a commercial or political nature.

We wanted to set such a thing up last year for JOTA and the ACA does not seem to have a policy on passing third party internet traffic so we assumed it would be the same as passing other third party (voice) traffic so would be allowable for things like JOTA - particularly in our case where the "back channel" was to be through an amateur AX-25 network back to the ISP and the download was to be via a satellite connection.

charlesb wrote:

> If somebody comes up with a subaudible tone data system, even at a low data rate, I'd like to hear about it.

Motorola land mobile radios in the pre-trunking days had an option for something they trademarked as "Digital Private Line". It was basically 100 baud data, IIRC, sent as base-band data with the voice (in other words, 100baud data stream directly mixed with audio). The radios obviously needed good DC-response. The sequence sent was something like a 23-bit pattern was FEC-expanded from a 16-bit or somesuch digital code. I think there was also the equivalent of traditional "reverse-burst", a sequence sent to mute the receiver when the transmitter unkeyed, to avoid a burst of unsquelched noise.

100 baud data has a base-band bandwidth well-inside traditional PL if well-filtered or sent use a raised-cosine/DDS arrangement. Alternating

1s and 0s produce a 200Hz sine wave. Existing PL filters in receivers and repeaters would filter DPL out as if it was regular PL. In this sense, it was quite compatible with existing PL.

Certainly DPL provides a wealth of interesting background; you can find examples of the hardware in service manuals for MCX100s and other 1980s vintage Motorola land-mobile. I'm sure other OEMs had similar technology.

They key item to successfully sending low-baud data over an FM transmitter is low distortion, which means a transmitter with near-DC response; this is achieved by modulating both the VCO and reference oscillator in a PLL system. Most ham radios I've looked at are unsuitable since they only modulate the VCO and the PLL will suppress modulation below 50Hz or so.

The other key lesson here is adopting a heavy FEC approach since you're not in a packet mode, you're bussing data along with voice. Send short chunks of data which are robustly FEC-encoded. It may limit what you can actually send during a normal voice contact.

Dana

You just did exactly what you complained about Stew.
You discouraged the use of ham radio.
Please take your MURS trolls to the appropriate newsgroup.
Seems like every time someone suggests using ham radio
you pop right up again and advertise the MURS solution.

Why is that?

Hi all

What is the best/easiest, freely available software to drive a soundcard for
various digital modes - AX25, WSJT, APRS, etc? (how about weather sat
images, or even sstv?)
I'm using a Windows PC and Alinco DR610 2m/70cm radio.

I won't try to tell you the best but here is a place to go and get many
programs for the sound card.

My office is located in a metal warehouse type structure which
effectively shields us from most outside signals. If I want to listen
to the radio or use my cell phone inside the building I have to open a
bay door. Is there a way I can get all those radio waves inside the
building without opening the doors. Is it possible to place an
antenna outside and have everything rebroadcast inside? The main
reason for this approach is the cell phone. It would be kind of
impractical to run an antenna from my cell phone to the outdoors.

Barring the rebroadcasting idea, I am still interested in what the
best way is to get better reception on the radio. Do I need to run a
wire outside or somehow ground the radio. Go easy on me, I've heard
some stuff about 7mhz being 23 feet long at a quarter wave. If your
gonna spring some of that stuff on me I need a little more detailed
information. I'm not up on radio lingo but I am technically capable.

TIA
The Bad Priest

While it may not work for you , look up "passive repeater" This is an antenna aimed at the desired station (on the outside of the building in your case) and a feedline inside the building hooked to another antenna.

For receiving other frequencies you may have to run a wire outside the building and either hook it to the receiver or wrap it around the receiver.

I have not seen it but have heard that in long tunnels they have an outside antenna and an amplifier and some inside antennas for the FM radio stations.

The passive repeater is an excellent idea. I have done that extensively at Radio Shack. We had a TV antenna outside for the TV signals. We would be sure to run a feed-line to the inside TV demo antenna, and to a automobile antenna in the "car sound" display. We could then give relatively accurate demonstrations of the small transistor radios and auto stereos. You wouldn't believe it, or won't believe it until you try it. Two antennas connected by as sort a feed-line as possible.

In most cases you have to be quite close to the indoor antenna (within a few meters), since the signal reradiated from the indoor antenna is suffering an additional inverse square attenuation.

The worst situation for a passive repeater system is when the repeater is in the mid path with the end stations A and B. The path losses (expressed in decibels) from A to the repeater and from the repeater to B are _added_. Compare this to the free space (line of sight situation) in which the total path loss from A and B is only 6 dB more than compared to the path loss for A to the mid point repeater location.

In a passive repeater system, moving the repeater closer to the other station, the sum of the path losses from A to the repeater and from the repeater to B (expressed in decibels) will be smaller than with a repeater in the mid path.

>I have not seen it but have heard that in long tunnels they have an outside
>antenna and an amplifier and some inside antennas for the FM radio stations.

Leaky coaxial lines are used as "antennas" in tunnels.

I've never had any luck using just one can. You could tie the string to a doorknob and use just one can - but what are you going to hear on it?

To make it work, have another can on the far end of the string, with someone speaking clearly into the can. Remember to keep the audio transmission line taut for best reception.

Dr Om's

I have a protocoll question...

The asterix, added in the path list, what meaning does that have???

Am i right in the assumption, that it identifies the transmitting digipeater
like this:

oz1aaa>oz2bbb,oz3bbb*,oz4ccc

This packet is transmitted originally from oz1aaa and is destined to end at oz2bbb, but the actual heard packet, is transmitted (relayed) by oz3bbb, since the asterix is added to it's call....

That is correct, the asterisk signifies the digipeating station which
you heard.

Hi...I've been looking around for one of the older Swan Transcevers...It
is The Model 250C
6 Meter Unit, with if possible the Matching AC Supply...I'm not looking
for a basket case, however. the radio does not have to be Mint either !
 Also the price has to be reasonable...or else I might as well go out
and but one of these new Icom mobile radios with multi-mode VHF-UHF-6
meters-and HF to boot !!...for some $ 725.00
Anyway if someone out there has one of these radios ...please drop me a
line and we can go from there...OK

Thanks a Lot
Carl

Your tin can will work much better if you add a piece of tissue a coil of wire and a magnet. I don't know why no one ever mentions that when talking about the finer points of tin can technology.

Well I guess a passive repeater was exactly what I was thinking of and it sounds like it works about as well as one would expect. Is there such a thing as an active repeater? Is there some way that I can amplify all of those signals. Can I broadcast all frequencies all the time?

Also, I'm still interested in grounding. I've been noticing the effects of grounding more and more lately. I just realized that my house isn't really grounded (as far as I can tell anyway). I've got PVC plumbing and the electric box is just wired neutral to common. Ever since I put a ball on my truck and wired up the trailer light connecter I've gone from great reception on the radio to average or poor. I think the trailer ground wire is acting like a maverick antenna. We got a new forklift that has a fiber strap that drags along the floor. I think the wheels are polyethelene or polypropoline or something and without the strap the forklift can generate enough static electricity to knock you on your ass. I lived in Okinawa when I was a kid and a lot of the cars there had a rubber strap with a little reflector that drug along the ground. The explanation at the time was that the Japanese liked lights. I never did understand but could it be to ground the vehicle and get better radio reception? Should I drag a chain behind my truck for better reception? Also, the radio at work; how should I set the antenna up. It's just two pieces of wire tucked up into the ceiling tile. There is a copper compressed air line running nearby that is not grounded directly (It is hung from the structual steel but there is no direct copper to ground). I've noticed that sometimes reception is a lot better if one or both ends of the wire are touching this copper line. Is the antenna being grounded or is it acquiring capacitance? WHat is the proper way to ground it. Do you ever ground an antenna or do you just ground the receiver?

Well that's probably too many questions already. I'm posting via google so i have to wait 3 to 6 hours to see it.

Thanks,
El Malo

and not that anyone is going to tell me but what is 73?

El Malo,

The 'static' strap draggin on the ground is a terrible idea. In most cases, it generates more static than it will ever 'cure'. It's also dangerous, just like the fork lift. The DOT prohibits static straps on commercial vehicles that carry flamable/explosive materials (fuel trucks) because they act as part of a "VanDegraff"(sp) generator. I'm sure a nice fat spark is exactly what you want to see when connecting a fuel line to a tank. (Also why fuel hoses at gas pumps are grounded through the nozzle. And why fuel trucks at an airport always connect a ground line to the plane before fueling.)

Has anyone actually tried Timewaves DSP- or PSK-upgrades ?
I've looked "everywhere" but I can't find a review or even
an impression of these.

Para el Hombre Malo,

I don't think there's any panacea solution to your problem but the passive antenna should help with your cell phone. Just have the inside antenna close to where you'll usually talk and the outside antenna high and in the clear. For your other questions, I'm sorry but I chuckled a little. I couldn't tell if you were serious at first but then figured that you're not a licensed ham radio operator.

Active repeaters: yes, often very expensive, Code of Federal Regulation legal issues and FCC licensure.

"All frequencies all the time": not realistically, I think it's called a transponder used on a communications satellite but on steroids.

Building codes require that your house be grounded. It's grounded unless you built it yourself and forgot to do it:)

Alot of things can affect your radio reception and to pursue all of them for a radio station is to joust windmills. Just make sure your connections are good. I wouldn't drag chains behind your truck because they attract bicycles and electric wheelchairs. Your truck is all the "ground plane" for your antenna. As for a radio at work, just pick up a simple antenna from radio shack if it's AM/FM. They're made for your application so it doesn't get much better or simpler.

You might consider looking up a ham radio club in your local area. They might have licensing classes where could learn about all of these issues and much more. If you're interested, a lot of "Old Men" (respectful term of address between hams) are willing to help you learn and improve radio communication skills. When it's said and done, you've earned your license for free. Give it a try if the idea strikes you.

"73" comes from old radio operator brevity codes that were used to send a common question or statement as short and easy as possible. I believe it meant, "Warmest Regards" or something to that effect since it's understood outside of language barriers. So, that's the way we commonly sign off.

  73's y un saludo muy cordial pa' ti y los suyos,

```

Hello All,

I have uploaded TrueTTY 2.19c beta to the main site and mirror:

http://www.dxsoft.com/truettyb.zip
http://www.truetty.com/truettyb.zip

RTTY and ASCII decoder was fully rewritten to improve decoding quality.

You feedbacks are very welcome!

Best regards,

Sergei

I am looking for the HOST MODE guide for KAM XL. Does anyone know how to obtain a copy. Kantronics is giving me the COLD SHOULDER. They sent me one several years ago on the KAM 5.0, but they must have changed company policy.

Thanks again Hank, yes I did get it and ... well unfortunately I have this
copy. Copyright 1995. I am specifically looking for a newer copy of the
document.
They may not have published one. I am sure they have updated some of their
commands ... especially for APRS and other newer modes.

I talked to Matt May who was going to forward my request to the CEO, but
that is as far as it got.  There is some 'agreement' he had mentioned, and I
am more than willing to look at it, provided they allow me that 'honor'.

It seems more and more companies are closing their doors to programmers.

Ray

If they won't send you the documentation, there is the time-honored technique of reverse engineering: monitor the serial port while running a host-mode application. I'll be happy to send you a copy of PortMon should you need it.

73,

Dave, AA6YQ

OOOOH AAAAAH ... I might be interested in it .   You know I really don't know what the big deal is. It isn't like I am stealing software. It would be just like the electric company refusing to tell you the voltage of your house.

I can't think of a good comparison.   I am needing to write some routines to update the repeater and I KNOW they don't have software written specifically to update a RLC CLUB controller.

I would also like to use it to find out what the stuff is between the computer and my Oregon Scientific WMR-968. They TOO are like Kantronics. But this isn't such a big deal ... they did have the foresight to output the data into a csv file. I can deal with that.

Ray

August 2003

Dear Amateur Radio Club Members,

As summer fades and we anticipate a return to the rigors of fall, you will be reinvigorating Amateur Radio club operations in your communities. But before you club launches its activities, I hope you can take a moment at your next meeting and consider a disturbing and critical topic - Broadband over Power Lines (BPL).

BPL is a devastating threat to the Amateur Radio spectrum - especially the HF bands. There has been a lot of publicity on this issue - articles on the ARRL website (www.arrl.org/bpl <http://www.arrl.org/bpl>) and other ham radio sites. Your ARRL is at the forefront of the campaign to defeat BPL and will continue to work tirelessly to protect your Amateur Radio bands. And you can help.

This summer individual hams - and clubs - have responded generously to fund ARRL's efforts to fight BPL, and have filed comments to the FCC. But we still need to raise an additional $55,000 to fund the field measurements and document filings necessary to defeat this threat. We're all in this effort together, so I hope your club will jump on the bandwagon and support the campaign financially. We've received club contributions ranging from $50 to $2000. If your organization has already made a donation, thank you.

And if your club is considering a contribution, I hope you'll do so right away. With a contribution of $100, $250, $500 or more, your club can join the roster of clubs that are joining the effort. Your commitment will make a tremendous difference. And we'll put a list of contributing clubs on the ARRL website this fall as our way of saying thank you.

If you need more information on BPL for your club, go to the ARRL website (www.arrl.org/BPL <http://www.arrl.org/BPL>) for the full story, including copies of the two FCC filings and a video that graphically demonstrates the interference radio amateurs would experience from BPL. The video can be downloaded and played at your next club meeting, and there's a PowerPoint presentation you can use. Just follow the link above to an "Understanding the NOI" page and a resource page where you'll find the presentation.

ARRL President Jim Haynie calls BPL the biggest threat to Amateur Radio in decades - and hams have lent their voices to the cause. If BPL becomes a reality, many Amateur Radio activities, like Field Day, will be meaningless. Your club's support with a generous financial contribution now will help fund this effort.

Thank you for considering this request. Contributions can be made on-line at www.arrl.org <http://www.arrl.org>, or by mail to BPL Special Spectrum Defense Campaign, ARRL, 225 Main Street, Newington CT 06111.

73,
Mary M. Hobart, K1MMH
Chief Development Officer

```

Hello All,

I have uploaded TrueTTY 2.20 to the main site and mirror:

http://www.dxsoft.com/truetty.zip
http://www.truetty.com/truetty.zip

Best regards,
Sergei
http://www.dxsoft.com

==

TrueTTY Versions History

V2.20
User can select optimal or wide filters via "Filters" menu in RTTY and
ASCII
modes now. Wide filters can be useful to decoding signals corrupted by
polar
flutter. Use optimal filters in all another cases.
V2.19
RTTY and ASCII decoder was rewritten to improve decoding quality.
V2.10
The documentation was updated.
Auto-recognizing of callsigns and control numbers was improved
in contest mode.
Some minor bugs were fixed.

I have a Yaesu FT-847 for sale. The rig is in as new condition and I have the original box and manual. In addition, I have replaced the stock SSB filter with an Inrad 2.1 SSB filter. The package also includes the following items:
- LDG AT-11MP Autotuner (as new)
- Buxcomm digital interface (HF and VHF cables)
- Yaesu FP-1023 power supply (as new)

I can only sell the complete package at this time and the price is $1450.00 firm.

Ray,

I dont know if Host Mode would do you any good using the TNC to do repeater
control. Most of the command you'd send would only be sent through the data
stream on one Packet stream. You could use terminal mode for that.

As you may not know, Pacterm for Windows is the only 32-bit program that
supports the KAM XL (as far as I know). For the most part, the host mode in
the XL is the same as the 1995 docs, with some minor changes for PSK-31 mode
for the XL.

The APRS commands are sent through the command channel and APRS data is
through the monitor channel.

You have got to be kidding if you think that there are many people wh
are dumb enough to click on that link without some kind of protection
against losers like you who have nothing better to do with their time
than try to hack a free email address. And how many groups did you
waste your time cross posting to?

Got a few questions about my new olympus stylus 400 (same as olympus 300).

1. When usb cable is connected to camera and computer, is the battery

recharging during this time?

2. With the optional ac adapter connected to the camera,
does this recharge the battery?

3. How do you take panaramic photos? When I select this option I see no
difference
when viewing the photos on the camera, they look just like a normal photo...
Is there some additional step I'm missing here?

4. Does anyone make a charger that can charge multiple batteries at one time?
the only one I've seen thus far is the single battery charger which comes
with the
camera

Hey Rick,

Up until April 28th (the day lightning took out the KAM and the Peet Bros. 2000, I was using a program I had written and was doing just that. I had a KPC-3 PLUS on repeater end and was using the KAM on the computer end. I had some interesting problems to over come namely getting rid of all the STAMP and CSTAMP stuff. I had to put it in and keep it in TRANS mode. I had to disable all of the ... ... damn ... well packet status thingy bobs.

You see anything that would cause either packet tnc to return a EH? ... HA HA HA I put those two TNC's thorough so much hell ... they would go in to these black hole loops ... repeating EH? EH?

Host mode is so much easier to work with than Terminal mode. The software was already written .. just adapting it to the repeater.

Thanks again Rick,

Ray

Hey Rick,

Up until April 28th (the day lightning took out the KAM and the Peet Bros. 2000, I was using a program I had written and was doing just that. I had a KPC-3 PLUS on repeater end and was using the KAM on the computer end. I had some interesting problems to over come namely getting rid of all the STAMP and CSTAMP stuff. I had to put it in and keep it in TRANS mode. I had to disable all of the ... ... damn ... well packet status thingy bobs.

You see anything that would cause either packet tnc to return a EH? ... HA HA HA I put those two TNC's thorough so much hell ... they would go in to these black hole loops ... repeating EH? EH?

Host mode is so much easier to work with than Terminal mode. The software was already written .. just adapting it to the repeater.

Thanks again Rick,

Ray

I have a Yaesu FT-847 for sale. The rig is in as new condition and I have
the original power cord, hand mic., box and manual. In addition, I have
replaced the stock SSB filter with an Inrad 2.1 SSB filter (although the
stock filter will be shipped to the purchaser as well). The package also
includes the following items:

- LDG AT-11MP Autotuner (as new)
- Yaesu FP-1023 power supply (as new)

I can only sell the complete package at this time and I am asking $1300.00
(facilitate purchase of a new radio).

I monitor VLF and have discovered a data signal at 300.0 KHz. It seems to be on continuously. I have searched the FCC databases and searched the web, but can not find out what this signal is. It is S9+10 in Maryland.

Can anyone tell me what this is or where I can search for info to try to identify it?

Thanks,

John

Are you near any high voltage transmission lines? Power companies use power line carrier to pass low bandwidth telemetry and relaying signals on transmission lines. They typically operate from about 300 kHz down.

Any programs out there that do PSK31 RX/TX under DOS, using a
soundblaster sound card?

You may try this one.

http://home.uwnet.nl/~pa3byz/download.htm

Also I think that the origional psk31 program will work with windows 3.1
which is really a dos type program.

There's a USCG DGPS station at Annapolis, but it's on 301.0 KHz.

All,

Thanks for the replies. I think the mystery is solved. I believe I am
hearing the DGPS station in Annapolis on 301kHz. I hear the same type (but

```
weaker) signal at 307kHz, which is the DGPS station in Hagerstown, MD.

Thanks all!

John

Hi,

Looking for info on the AMT-3 AMTOR/RTTY terminal made by ICS in the UK during the 1980's. A copy of the manual would be great or just the control codes and D connector pinouts.

73,

```

I am new to Ham Radio. I am very interested in APRS and Packet radio.
As I start to build my ham shack and complete my vehicle for RACES
what is some good advice for me? I work mainly with Mac computers in
the design and graphics area so I am currently shopping around for
```

cheap PCs to install in my Ham shack and an old laptop for the vehicle
to do APRS. I listened to some interesting conversations on VHF
concerning the above subjects but as you would know it is not the
complete picture. So if you were starting out in too this two fields
of Ham radio what advice would you give if you are an Elmer to a
newbie. I am interested in buying used equipment when possible.

regards,
Robert

For most ham radio use, junker Pentium machines work well.
I have a couple of them in the shack, picked them up from
friends or relatives who had upgraded and were going to
toss out the old machine. You might need to find a few of
those free old junkers to get enough working parts, but the
cost is right :-)

Why do they all rely upon the kernels AX.25 ?

Kiss mode is limited to packet radio (at least with
the TNC's that I've got) and why would I want to run
packet radio on hf ? Pactor is better for hf and that
means I can't use any of all those "terminals" that
really rely upon the kernels ax.25 to do all the work.
Why pay lots of money for a competent controller and
then make it really stupid by using kiss ?

A lot of the Linux stuff is like that. When you wander away from the mainstream, this is to be expected. Part of the problem is that most software for Linux is open source, written by junior programmer wannabees, then re-hacked by other "programmers" who are no better.

... So the third-weenie OS is loaded up with third-weenie software.... Is that a big surprise?

If you really wanted performance, you'd be going with #1.

Hello All,

I just have uploaded TrueTTY 2.22 beta to the main site and mirror:

                                     http://www.dxsoft.com/truettyb.zip
                                     http://www.truetty.com/truettyb.zip

---
WBR,
 Sergei

 ==============================================
                     TrueTTY Versions History

V2.22
 BPSK31 and QPSK31 decoders were rewritten.
 QPSK31 decoding quality was vastly improved.
V2.21
 AMTOR-FEC (SITOR-B, NAVTEX) decoder was rewritten.
 Decoding quality was notably improved.
V2.20
 User can select optimal or wide filters via "Filters" menu in RTTY and
ASCII
 modes now. Wide filters can be useful to decoding signals corrupted by
polar
 flutter. Use optimal filters in all another cases.
V2.19
 RTTY and ASCII decoder was rewritten to improve decoding quality.

I really could not agree less.
There are loads of good projects around for linux, written by really
good programmers. The "Visual Basic" miseries plague that other OS,
not linux.
The ax.25 kernel module is not a problem with that other OS for the
simple reason that such a module is not even remotely possible.

If i really wanted instability, viruses, constant upgrades, need for
expensive third-party antivirus, expensive office software and all
those other problems related to the QDOS-Windows OS then I'd switch
to it.

Robert

First of all, go have a chat with your local EC/RO.

A lot of amateurs feel that they can contribute in an emergency by being prepared to operate portable or mobile without commercial mains power. This is one dimension, but unless you are connected to your local ARES/RACES organization, and understand the procedures, your primary contribution is likely to be delivering coffee. When there is a serious problem of some sort, there just isn't time to train folks that want to help. You need to be connected with your local folks well ahead of time, so you can learn just what has to happen in the event of an incident. If you don't know who your local EC is, contact your SEC (k5mwc at arrl.net) to find out.

VHF packet can be an inportant component of emergency response, we use it extensively up here, but it will be totally useless unless it is a component of YOUR county's plan. This is another reason you want to get with the local folks and understand your local infrastructure.

The suggestions about a junk laptop are pretty good. If you are using a TNC, it doesn't take much in the way of a computer to operate packet. If you are looking at a used laptop, I would take care to find one with a decent battery. For many old laptops a replacement battery will cost more than the laptop.

The TNC is an expensive bit and it's a pain to carry around yet another box for portable operation. Of course, one advantage to you is that with the TNC, there's probably no need to leave your Mac behind. There are now software only packet implementations, but if you choose this route, you will want a little beefier computer. It doesn't need to be some killer machine, just something that will run Windows 98 reasonably well. I would look for something like a Pentium II, although you probably could get away with a Pentium. It needs to have a decent sound card built in, many early laptops didn't so look at this. For use with a TNC, you are just as well off with a 386/486 type of machine, which are amazingly cheap these days.

If you intend to do a bit of experimentation, you may want to avoid the newer NT/W2K/XP machines for the time being. They throw a lot of roadblocks in the way of some of the ham software, and it's probably worthwhile waiting until the software catches up before jumping on that bandwagon. However, if all you intend to do is packet, MixW does work reasonably well in the newer environments.

Hope this helps..

..

You don't quite "get" open-source, do you?!

I want to electrically isolate the transceiver from the tnc.
On 1k2 the job is easy: two audio transformers and an optocoupler work well.
But for 9k6 ? How to get rid of square wave translation ?

Rat shack coco. My first glass tty for rtty was a coco with the chicklet keyboard. A little bit of code to sample the center of each pulse 7 times 1 msec apart to determin if mark or space increased copy significantly over the model 28. The coco was also a hell of a lot quieter than the 28 :-)

Heh... open-source does not automatically equate to good. Or it shouldn't, anyway. As in just about anything, 90 percent is crap. There's some good open source stuff out there, but I've not found much for amateur radio.

On the plus side, what is avaiable makes minimalists such as myself happy. I'd rather have 10 programs that do one thing well rather than one program that does 10 things. I seem to be in the minority in this respect.

That's true, however, there seemed to be an implied message that all
open-source was junk, at least compared to the excellent-quality (snigger)
stuff from Redmond...

Greetings,

ID Wizard is an ID timer with system clock setting and miscellaneous tools.
Very handy for any shack machine and others.

In addition to the ID timer, tools include:
Notes - a full-featured text editor

Calculator - with tape display
Conversion Utility - Area, Distance, Mass, Power, Temperature, Time and Volume
Net Utility - Trace Route, Ping and WhoIs
Time setting via the net with Simple Network Time Protocol

Download from:
http://www.taborsoft.com/softstuff/idwiz/

Home of: WinCAP Wizard 3, GeoAlert Wizard, Active Beacon Wizard++, Beacon Wizard, KCal+, NERDAlert, ID Wizard, Alert Wizard, Beacon-Time Wizard, Beacon-Prediction Wizard and more.

It has been our experience over the years that "free" or inexpensive software is held in low regard. This is extremely puzzling, since many feel all software should be free. Personally, I enjoy providing a few "free" apps. Unfortunately I've yet to win the lotto, so the software must support itself - but that's all a different story and you should not be burdened with such.

However ID Wizard isn't free. The requested fee is an email with "any kind" of comment or suggestion.

All comments welcome. We would appreciate any thoughts on these subjects. Thanks for your time and kind consideration. You are also welcome to get my email address from the web site, or qrz.com. We receive many, many, junk email to the address used to post the occasional Usenet message; therefore they are sent to the bit pit on the server and never seen.

73,
Jim de KU5S

I've never heard any activity but I'd really like to try it out on the air. I've just tried it locally and it's a nice mode indeed. I'll call a few cq's there and try to monitor that frequency.

I heard a Q15x25 signal a few nights ago on 20meters, 14.110 LSB, something in that neighborhood.

I tried Q15x25 on HF and was not satisfied with its performance under poor conditions. Throughput would drop to 300 baud packet levels or less, but I was still taking up enough bandwidth for six or seven HF packet QSO's! That was not impressive.

When the band cleared up though, it would perform as advertised, very fast for HF.

If you use the Flex32 implementation of Q15x25, called "newqpsk", it is possible to gateway Q15x25 mode to VFH/UHF packet, a BBS program or what have you.

I thought about BBS forwarding with Q15x25, but nobody sounded interested so I went back to 300 baud packet. It's better under poor band conditions, and that's what we mainly get right now, anyhow.

Q15x25 is fun to play with though. I hear the Q15x25 enthusiasts use it to swap JPEGs on the air. The images come through 100%, not all static-spattered like SSTV images are, most of the time.

I forgot to mention that there is a "Yahoo group" called Q15x25 where you can find out about freqs and maybe dig up somebody to QSO with.

Go through the posts there, and you'll soon be up to speed on all issues related to Q15x25.

I am wondering about anyone out there who is using the newer KAM XL. I am having a hard time getting it to set up. It only goes to 'ENTER YOUR CALLSIGN=>'. The moment I put in my callsign, it stops. Kantronics said that if the RTS line is connected and the software doesn't activate the line, XL will stop communications. I have tried this on three different computers, changed serial cables, and used three different programs (Hyperterm, Windows 3.1 Terminal, Procomm, and my own program which I know activates the RTS line), with no difference.

Does anyone having used the XL know what I might try next.

i've just two mx614 modem to do some tests
i used the FX614 chip and KENWOOD TH25A to do it,the PTT part and the
transmiting part is OK,but the receiving part can't work steadily,
i've a lot of improving but still cannot find the reason,so could
someone help me!
thanks

I am looking for something that will permit a handheld PC running
under HPC Pro 3.1 (CE 2.11) to perform all necessary terminal
functions, including the printing of messages.

Windows Terminal is installed and it can do most of the job, but it
can't direct RX to the printer without manual cutting and pasting.

You know, I finally get set up to be able to operate on HF from my
apartment by using CW and the in-the-mud signal digital modes such as
PSK31, 10 and Hell and what do you know this trash-hash comes along!
It is bad enough that I had to deal with light dimmers!
The general public is the most ignorant political animal that has to
be fed for votes. Politicians dread having to go into any type of
teaching mode and they hardly ever bother being educated themselves.
"My constituents" does not include YOU! You weirdo strange noise radio
tuning person!
The politicians are too lazy to take the time to explain to the big
companies that this sceme is harmful to HF reception, that they have
to take the expense to build the infrastrucure of a shielded type of
system. This is the easy way out. The people must have their bread and
circuses. I used to care about the general public until I realized
that they tend to crap where they all eat. Perhaps they don't even
deserve our efforts to help them if they allow this to go through.
It is thumbs down time as we are about to be fed to the lions. It is
all fun and games till someone loses an eye as they said in Rome.
I am going to write my politician if only for amusement purposes.

I'm about to move to a location with no landline telephone service and could use some advice.

For voice communications (non-amateur, of course) I have a cell phone, and for computer communications I have a Direcway 2-way satellite connection. Here's the problem:

In order to activate the satellite at a new location, or to "reset" it if a problem develops--which is about once every couple months--I have to use a standard dial-up networking connection and connect to a toll-free number at direcway. The call is usually 2-3 minutes in length and just transfers info about my site id and authorization numbers back and forth.

As no other means seems to exist--my cell carrier doesn't offer Internet connections--I would like to be able to use the

autopatch on a local repeater to make my connections. Since the use is
strictly non-commercial, it should be a legal use of the equipment,
but I have no experience with autopatch/computer interfacing and don't
know if it's possible to "Convince" Windows XP to recognize the
connection as a valid dial-up networking one. I've tried using my cell
phone as a modem (it's a Motorola V60i TDMA version) but, while
Windows installs the drivers for it and recognizes it as a modem, when
I attempt to connect with it, the system dials, immediately
disconnects, and tells me the remote computer failed to answer--my
concern is that the system will do the same thing with a connection
via autopatch.

If anyone can provide some feedback on this, or other
suggestions (I have only HF, 6M, 2M, & 70CM available and will be
living in the Union City area of Michigan) it would be greatly
appreciated.

Thanks in advance,

73 de KE8HH, Rick

Non-commercial to you perhaps. Not so non-commercial to DirectWay. I would find another way if it were me. And I definitely would have the permission of the repeater trustee is I decided to go ahead anyway. He might take a dim view of the fine he had to pay if the FCC and I see this matter the same way. Admittedly worst case scenario but accountants (except those at Enron) are trained to anticipate all losses and provide for no gains.

Hello,

I'm wanting to be able to uses my laptop and communicate back to my home computer via packet. I was wondering what software I need to do this. I want be able to in my computer back home and get files off of my home computer when I need them and put them on my laptop.

Todd N9OGL

With the relaxed rules such as ordering a pizza legal now I do not see any problems with this as all he is doing is ordering a service and the regular telephone is not possiable. I do agree he should talk it over with the repeater trustee.

One big problem is that it will not be full duplex and will probably be limited to 2400 baud depending on the band. Maybe 9600 on a good day on a good band and radio. The duplex problem could also be overcome but will take some work unless the repeater will crossband.

Yes, I see your point. But when you order the Pizza, the Pizza Shop does not use your radio to prepare the Pizza. That is why I placed the caveat. In this case DirectWay is using the ham equipment to reprogram a receiver that has gone a wandering. I do not know if there is a difference there, but before I did it I would; 1. do some serious research and see if there was a definitive answer; 2. see if I couldn't find another way to do it.

Short distance (hundreds of feet)?
Medium distance (dozens of miles)?
Long distance (hundreds of miles)?

There are some solutions for all of those cases.
They are very different ...

Just remember - you may NOT do any work/business related communication on ham bands. That would presumably include transfering work related computer files.

All of that is a moot point. It won't work to begin with.

End of story.

If you can force your cell phone into AMPS mode (analog mode), you might

have more success. TDMA is pretty much useless for data. I assume your phone has a built-in modem, and can accept a direct data connection. If so, there may be flow control parameters that would need to be set, due to the relatively slow data link speed.

NNTP-Posting-Date: 12 Aug 2003 14:26:29 GMT
Xref: archiver1.google.com rec.radio.amateur.digital.misc:7898

For Sale:

Toshiba Libretto 50CT Sub-laptop PC

Very small, PDA size, about the size of a VHS tape
P50, 16 Meg RAM, 810 Meg Harddisk
Active Color screen, built-in mouse
1 PCMCIA type 2 slot, built-in Yamaha Soundcard (originally playback only)
with:
port replicator - serial, parallel, & VGA ports
1.44 M PCMCIA floppy
PCMCIA portable CDROM (non Toshiba)
3Com PCMCIA 10bt Ethernet card
33.6 baud PCMCIA Eiger Modem card
Toshiba OEM Windows 95 OS installed, no restore disks
battery (used works)
AC power supply
manual

The Good - The Libretto is in good condition and works well.

The Bad - Only known problem is 2 vertical columns on the extreme left

side
of the screen are partially out (incorrect color or blank depending on
the
background, does not affect screen view), both top latches are broke.
Infrared port removed for audio input mod (below).

The Excellent - The pc has 2 mods.
1. Selectable Overclock, the pc can switch between 50 or 100 Mhz at
power up
(details to be provided).
2. Audio input has been added to the built-in sound card (original pc
has no
mike or audio inputs!). It is mono only but it does allow the Libretto
to run PSK-31 (or other soundcard programs requiring audio input). The
mod sacrificed the IR port to get space for the input connector.

This has been my portable PSK-31 pc, but I need to upgrade to a pc
with a larger screen.

Asking $225.00 for all

73 - Dave

One more issue - encryption. You can't use it on the ham bands. Even if their data is not encrypted in the common computer sense (which it probably is), if it is a proprietary format that in itself would be considered encrypted.

I would suggest trying an analog cell phone connection at slow speeds. They used to sell modems that worked with the analog phones back in the day. I think the best I ever got was 4800 baud on a good day. While the digital phones may allow you to pass data, it is direct data between the phone and the cell provider, in true data mode. Any of the digital phone formats are not friendly with regular modem data.

Yes, you will need at least v8.2 firmware I believe for GPS commands, the latest is v8.3. It's max baud rate is 1200, you would need a KPC-9612 for 9600 baud but that's really not necessary as the national APRS frequency is 144.39 at 1200 baud.

Typically I think it's TCP/IP BBS's that use 9600 baud to pass mass amounts of traffic, and that's usually over 440 I believe.

KPC-3+ is a nice TNC. I have two, and a KPC-3P-GPS Tracker in the car which has a built in GPS into the TNC, so all I need is the TNC and radio to transmit GPS positions and GPS Telemetry. And plug in the laptop into the serial
cable tucked into my glove box for keyboard to keyboard/pbbs operation. :)

```

http://www.eham.net/classifieds/detail/101177

I have for sale 2 cables from Buxcomm, never used, still in the original
packaging. I bought these for projects that I never did.

I have the following cables:

(5DI8MX) TNC with 5 pin DIN plug to Icom 8 pin Mic and ext speaker jacks

(KVI8MX) Kantronics 9 pin radio port (plug is a 9 pin male serial plug) to Icom
8 pin Mic and ext speaker jacks.

Asking $12 each plus $3.85 shipping by Priority Mail (within the lower 48).

Perhaps yesterday's, continuing massive power failure in the northeastern U.S.A. and Canada will convince the power utilities that they should focus their energies and resources on their core business, rather than entering a new business that is already served by telephone companies, competitive local exchange carriers (CLEC), cable television operators, satellite services and, in some markets, broadband wireless access (BWA) carriers.

According to the August 15th Toronto Globe and Mail, "critics have been calling for breakers to be installed throughout North America's grids for some time, only to be told by the grid operators (power companies) that there is no money to fund such a massive infrastructure overhaul."

Why would regulators, politicians and the power companies' shareholders be interested in spending billions of dollars entering a new business when they obviously have major challenges in their own backyard. Seems like time to "stick to the knitting".

I have for sale 2 cables from Buxcomm, never used, still in the original packaging. I bought these for projects that I never did.

I have the following cables:

(5DI8MX) TNC with 5 pin DIN plug to Icom 8 pin Mic and ext speaker jacks

(KVI8MX) Kantronics 9 pin radio port (plug is a 9 pin male serial plug) to Icom 8 pin Mic and ext speaker jacks.

Asking $12 each plus $3.85 shipping by Priority Mail (within the lower 48).

There are certainly points where individual utilities connect to the "grid"
that would allow them to disconnect when unstable conditions are detected,
but I suspect the real problem is that many of them can't do it without
suffering major load shedding because they are buying, rather than
generating, a lot of their power. Cutting off a lot of their customers on
their own will bring political heat (like who gets to be the lucky ones). On
the other hand, when the gamble fails and there is a complete failure, just
blame it on "the grid"

I prefer MSYS, it's easy to setup and has a nice interface compared to what's available... Runs under MS-DOS.

For dialup BBS, I like SearchLight (dunno if still available) and WildCat BBS. They have had a Windows version for quite some time.

SynchroNet is a nice dialup/telnet BBS too, used with HyperTerminal you can use ANSI graphics.

I have for sale one Handspring PDA to 25 pin serial cable. The 25 pin end is
male. I bought this to hook up my PDA to my KPC-3 for APRS, but never did it.
It's still sealed in the original bag. Asking $40 plus $3.85 shipping Priority
Mail.

Additional information in th news today confirms what you
have suggested. It all indicates that corrective activity
is going to cost lots of money and require major resources.
Power utilities may have been loathe to pursue thes "core
business" activities because funding was not here for
various reasons. Hopefully the fallout from this incredibly
expensive and frightening exposure will be removal of the
regulatory and corporate constraints - and a clear mandate

to focus on grid and generation plant improvements. Never mind new business ventures with questionable economics and huge capital requirements.

WB2JKX wrote in message ...

>>
\>There are certainly points where individual utilities connect to the "grid"
\>that would allow them to disconnect when unstable conditions are detected,
\>but I suspect the real problem is that many of them can't do it without
\>suffering major load shedding because they are buying, rather than
\>generating, a lot of their power. Cutting off a lot of their customers on
\>their own will bring political heat (like who gets to be the lucky ones). On
\>the other hand, when the gamble fails and there is a complete failure, just
\>blame it on "the grid"

Is the PacTerm file found on Win 98 the same as the file on win 95. In other words, I have a laptop with only a basic '95 load, and a full load of '98 on another comp. Can I transfer the PacTerm file from '98 and use it on '95?

It's been a while since I had a decent qso on a digital
mode on hf. What I get is connect frames probably aimed
for the winlink system and pactor-2 stations of course.
I don't want to spend 699$ for a Pactor-2 system as they
are certainly fine modems but a huge overkill for my needs.
Even if I did spend all that cash I'd probably only
see the winlink system anyway so that's not an option.

So my question is: is there anyone trying pactor-1 or
perhaps gtor for anything besides automated message
handling and forwarding ?

I've used a KPC-3 (no plus) with APRS...no problem. I believe the extra firmware is required for use with no PC. I don't know what type of setup you're using, but if your palm does the APRS stuff, then it I assume it can format a message and tell the KPC-3 to send it....no problem.

No, it's a bit sad really. I had a number of nice pactor qso's
but now pactor seems to be killed by winlink&pactor-2.

Wait, as I type I hear a CQ on 40 m. Connected, I guess it isn't
quite dead yet ! Bad conds but a QSO !

Doesn't really matter if it would or wouldn't work.
The fact remains that your using the Amateur Radio Service to facilitate the "commercial" interests of Direcway.

Let Direcway figure out the answer, I'll bet they find one, Esp if it means their $$.

I've been thinking about this recently to try and bridge two activities. With a decent setup, I can do APRS or I can work a repeater. I don't have all the gear so I haven't tried real APRS yet. My thought is that I'm not concerned with a VHF station in California when I'm local in Florida. All I'm really interested in is the local picture. So, would it work to move a digital picture over a local repeater and remain capable to speak? If that's true, why wouldn't we do it locally? Pros? Cons?

This might even spark more repeater traffic since a) you'd see folks on the display or b) you'd hear signs of life even if you don't have APRS.

I'm curious what this means. Do you mean APRS stations that
link to each other?

I am just starting to explore the world of APRS, so I am feeling my way along here. As I understand from reading the manuals for the TinyTrak and MIC-E tnc's, there are repeaters that can extract the APRS tone burst when making a voice contact on a normal repeater and rebroadcast it into the APRS system. I assume it would be like a digipeater on 144.39.

Findu only finds APRS stations transmitting on the system.  You can
find me on there.  I am looking for voice repeaters that cross-link
into the APRS digipeater system.

If you had seen any, it'd be a good trick, considering that no repeater I've ever heard of links to APRS.

Now, if you're talking Echolink, that's a different game entirely.

http://www.king.igs.net/~karc/modes/echolink.htm

Good hunting.

The capability to do so may exist, but it's another question entirely as to whether anyone has actually taken advantage of it.

My understanding of APRS is that it is simplex-only, with a nationwide frequency of 144.3900. No voice repeaters are involved. It's all data.

If this has changed, I would be as curious as you as to what happened, and when.

Unfortunately all those addresses use
ftp://147.229.35.11/pub/hamradio/Xpr/
link and it is invalid. I am still
looking for this application. I will
be greatful for good addresses or if
somebody will send this program to me.

What you are talking about is described in MIC-E.TXT, which is one of
the documents distributed by WB4APR with his DOS APRS package. I think
it was originally written about 10 years ago.

From the comments being made, it sounds like you folks over there never
implemented the idea?

The TAPR manual I have was revised in May 1997. I am going to pursue this out of curiosity more than anything else.

After reading Don N2IRZ's great article on PSK31 in the August 2003
issue of CQ magazine I decided to give this digital mode stuff a try.
I stuck a headset microphone on top the the speaker of my TS570,
rubber-banded a pair of headphones to the hand microphone of the
TS570, adjusted the VOX sensitivity, and downloaded the Digipan
software. It worked! I was even able to pull off a couple of QSOs.

Next I decided to try and build a "sound card interface" cable as described by Don in the article. Basically this interface connects the line in and line out from the PC's sound card to the Audio Out and Audio In pins on the ACC2 jack of the TS570. I left out the PTT circuitry since I already have an RS232 cable between the rig and the PC, assuming I could just use that PTT circuit. Receiving works great, other than some noise coming in on the line, the signal is getting decoded and displayed properly. Transmit, however, is not working. When I switch to TX mode in the software the rig is keying up, and switching to TX mode, although the audio does not seem to be making it. Basically it's tramsmitting an un-modulated signal. I did notice that the mic is open though, as when I tap on it the ALC and power meters move. A quick check with a multimeter shows that something is getting through the interface and to the correct oin on the ACC2 connector.

So, finally, my question. Do I need to use the PTT line on the ACC2 port to get the TS570 to "hear" the audio coming in on the ACC2 connector, or should the PTT on the serial cable work? I guess the simple answer to my question is "build the PTT circuit and find out!", eh?

Cheers,
Steven K4RVA

I ran into the same problem. My interface controls the keying circuit via the serial port. Connection to the TS-570 is via the 13 pin DIN connector.   I found that with MixW I could also key the rig using CAT commands. After I disconnected the PTT line from the serial port and hooked up the CAT cable, I found the radio would only transmit an unmodulated signal. The solution in my case was to reconnect the PTT circuit and add another serial port for the CAT.

> 73 de Roger, K4RS

Thanks Roger. I was hoping that was the issue, and that I had not messed up something with the interface. I can see about 0-200 mV on the AF IN pin of the ACC2 connector, depending on how I adjust the variable resistor, when I transmit from MixW. Any idea how much signal is "enough" to output a properly modulated signal? I was just going to adjust the input level until the ALC meter showed a slight deflection.

Cheers,
Steven K4RVA

Help...

I need the wiring info to connect my KAM to my Icom IC-280. If you can e-mail me a schematic (at least showing the connections to the 4 pin mic) I would appreciate it!

Thanks

Joe

NNTP-Posting-Date: Thu, 31 Jul 2003 09:24:57 EDT
Date: Thu, 31 Jul 2003 09:37:47 -0400
Xref: archiver1.google.com rec.radio.amateur.digital.misc:7850

I just got a second hand KPC-3 and I'm trying to connect it to a Kenwood TMV7A using the interface data cable, the PG-5 , I found some connection diagrams over the internet, and I have the manual, but I don't have the starting guide or something, and so I did the connections using the DB9 port but:

-) I see the TX light go red, but monitoring myself I cannot heard the noises product of the TNC.

-) I have never seen the RX green light turn on, I have move the squelch to every position, on and off and I never got the RX light to work, does this light only turn on when the TNC receive a AFSK tone in the transmition? or it suppose to light even when the squelch is of?...

So if any can help me with a good wire diagram from a Dim connector to a DB9 for a Kenwood TMV7A , or maybe tell me about the lights, I will appreciate it.

Also, the TNC seems to be ok, I can access it with the computer in

HyperTerminal, also I can access the mail box, but It seems or that I
haven't connected it right or that something is wrong with it.

And also if someone knows a freq for a gateway or something to try the TNC
and the packet thing since I bought it to experiment and see how this work,
I'm located in the Miami-Ft. Lauderdale area.

Thanks,
YY5-ADS

> -) I see the TX light go red, but monitoring myself I cannot heard the
> noises product of the TNC.

TX audio not connected right, or transmit level adjustment turned all the way down.
I think you might have to enable the interface on the radio too, but I'm not sure.

> -) I have never seen the RX green light turn on, I have move the squelch
to
> every position, on and off and I never got the RX light to work, does this

That only happens when it hears modem carrier.
Try the commands: "Int term" and "cd soft"

> So if any can help me with a good wire diagram from a Dim connector to a
DB9

> and the packet thing since I bought it to experiment and see how this
work,
> I'm located in the Miami-Ft. Lauderdale area.

144.39 is the nationwide APRS frequency, that should be active pretty much anywhere.
I don't work conventional "connected" packet anymore, just APRS.

Subject: Is a KPC-3 ok for APRS?
Message-ID: <20030731225536.20295.00000828@mb-m29.aol.com>
Xref: archiver1.google.com rec.radio.amateur.digital.misc:7852

Hello all. Me again. I'm still looking into the whole APRS thing and I have another question. If I do go with APRS, I think I will be getting a Handspring Visor Prism with the Magellan GPS Companion. Since the GPS will be directly conntected to the palm, I will only need to connect the TNC to the palm. Will the KPC-3 be ok for this? From what I've read, it will work, but I believe that the KPC-3 is only capable of working at 1200 baud. Is this a major deal, not being able to communicate at 9600 baud? Should I just spring for the KPC-3+?

Hopefully someone can help me. I just downloaded and compiled the WA4DSY Linux APRS server.

The compile and install went very smooth.

With a few tweaks to the 4 config files, I brought it up.. I pointed the Java Applet at the server and voila, the map started filling up with stations..

On the TNC side, I have the TNC attached, however I have not fired up the radio side yet.. I wanted to make sure the traffic flowed properly before I did that.

After running for a while, I noticed that the igate was not showing on the map. I went to findu and looked under my call sign and -- nothing..

So it seems the inbound is working, but the outbound is not.

I did run the aprspass program to set the password to the value for my callsign.. What am I missing.. I have sent the author an email, but as of yet, no response.

Any thoughts?

Second Question - I'm running this igate because the machine I am running it on is my IRLP node. I was hoping to use the program udp_example and load the position for my IRLP node and follow the IVRS speck for the position record.. That program talks to port 1315.. How would I structure the message to that port to send out my node's position?

Thanks for any pointers..

```

I believe that you have to have a properly
licensed control operator, at a control point, for
any transmission made on amateur radio except in
the case of emergency. Emergency is further
defined as threat to life and property.

I have, on various boy scout camporees, place a
two meter, rock controlled radio, set on 52, in
the disaster sight. The boys were on there own,
but there was always someone with a stronger
radio, close at hand, to monitor, w/o the boys
realizing it. Never had a problem, and did some
sole searching about definition of control point.
Decided that the stretch, if any was worth it, and
I was willing to defend my decision if necessary.

  Leo and I kicked this around in private e-mail, and because of lots
  of facts that you don't know, the use of amateur radio for this
  project is NOT proper.

  Gotta' know the whole story before you dispense quasi-legal
  advice.....especially when said advice is incorrect.

Howdy!

Last weekend I attended the Austin, Texas Summerfest, a ham get-together and the ARRL West Gulf Division convention. There were about a thousand hams there, with a great flea-market, and several presentations including one by your truly on packet radio.

The most interesting presentation was the ARRL president's forum, where ARRL president Jim Haynie talked to a large room packed with hundreds of hams. Most of his time was spent talking about the BPL (broadband over powerline) issue, the most serious threat the hobby has ever encountered.

Mr. Haynie showed us a short film taken in New York state, where the broadband over powerline system is being tried out on a test basis. The film was taken by ARRL engineer Ed Hare. It showed Ed driving around the neighborhood where the BPL system was being tried out, with an HF radio in his car. He had an HF antenna on the car of course, for the TS-430 he used for this test.

As Ed drove along, he would slowly turn the dial on the HF rig, across the 20 meter band. At no time could a human voice or digital signal be heard - only one "birdie" of interference after another, all across the band. Ed switched over to 15 meters with the same results. No human voice, no CW, no digital sigs, just "birdies" from the broadband over powerline system that was being tested.

In the film, ARRL engineer Ed Hare was driving down the street, recieving interference from powerlines alongside the road. In your hamshack, the interference will come right into your shack, radiating from all of the wiring in the walls. - A much worse situation than the one Ed was demonstrating for us in the film.

If BPL is implemented nationwide, as is being proposed, then US hams will be wanting to sell their HF equipment to foriegn hams, because the equipment will be useless here in the United States. We will have to kiss HF Amateur Radio goodbye.

Considering the damage BPL would do to Ham Radio and several other services that utilize HF frequencies, with the overwhelming RF pollution it generates, you would think that the whole thing would be shot down in short order. - Unfortunately this is not the case. The federal government is under enormous pressure to make universal broadband Internet access a reality, and BPL is the only system that shows any potential for delivering this in the near future.

What Mr. Haynie of the ARRL was telling us was that Ham Radio in the US is currently in a fight for its life, and it is going to be a very tough fight.

I am sorry to have to report such news, but it needs to get around. This is a serious situation, requiring a serious response.

President Haynie recommended that hams write thier congressmen, and to remember to use the word "pollution" when referring to the interference of BPL, as this term has great weight in washingtons' political circles. Its a word even a congressman can understand, I suppose!

Also: this would be a good time to join the ARRL if you are not currently a member. They have some of the political apparatus needed to fight this battle in Washington, but will need funding. If you are already a member, consider making a donation.

This is a serious issue.

Hi guys, i'm assembled a circuit to transmit positions over radios, and i'm having a little trouble:

I'm using Linux soundmodem as my packet decoder.

If i connect the sound output directly into the sound card of the Linux box, all sent packets are perfectly received and decoded.

If i connect the sound output to a Motorola Talkabout, and the output of the other Talkabout into the PC sound card, i also get all sent packets decoded correctly.

But....

If i connect the sound output to a Motorola PRO5100 radio and the output of the other PRO5100 to PC, i get many lost packets.

Sometimes, from 10 sent packets all are received...sometimes none....there is no logic in it.

Finally, the radio seems to be cutting the signal from time to time...

any idea?

[]s Rafael.

Check the audio bandpass of the 5100. Maybe it can't handle 2.5 kHz.

Haven't done packet in a while but...

A too-short TXDELAY (or the Linux equivalent) will cause problems.

Another poster mentioned bandwidth of the radios. Since you have a PC
+ soundcard you can do a quick check with a PC-based audio spectrum
analyzer program. There are a bunch of them, shareware, freeware,
etc. When experimenting with 9k6 packet I plugged an audio signal
generator into the input of one radio and sent the output of the
second radio to the PC soundcard.

There are also PC-based audio signal generator programs.

Good luck,
Jim

Hi Bill,

The SEA and Midland LMR 220Mhz repeaters & radios are now appearing on the surplus market, pulled from the (now bankrupt) narrow band trunking systems.

Securecor and Intek were large 220 smr operators in the late 90's. They had systems out here on on the US West Coast from Texas to Alaska.

They are hybrid ACSB units, the LMR and SEA formats do not work with the other.

SEA is still on line selling repeaters, however they probably wont do a lot to help you convert the equipment to Amateur Operation.

Two Surplus Dealers are selling used ACSB radios and some repeaters, look for them using the Ebay IDs of erac and rhoadeseller (might be rhodeseller).

I bought much/most of the 220 antenna combiner equipment as it is very high quality (Sinclair, Decibel, Wacom & Telewave) gear, of which I'm slowly parting out to get some of my money back. Watch for my auctions on Ebay if you have interest in this sort of stuff.

You might be able to make some of the radios talk to each other on simplex (direct), then figure a way to move them up onto the amateur band after you get the programming right, but it's not a beginers task.

There are a few 220 smr system operators still in operation around the country, you might do a reverse lookup on the fcc web page and contact those people you can find for information.

cheers

Thanks for bringing this to our attention Charles. However, there are a large number of Amateurs who don't have access to HF frequencies and for us this is a non-issue. I play packet on VHF and up because I don't have a Morse code endorsement. I've tried, but failed the test after countless hours of studying. So I have resigned myself to use the frequencies I have access to, to the best of my ability, and have given up on the HF frequencies that I will never have access to.

Take my advice, give up on HF too. It's a dying allocation with limited usefulness and only accessible by "elite" hams who can pass a test best left to dinosaurs.

I won't miss HF when it's gone, but I will enjoy the high speed internet access when it arrives!

73,

RaOuL

If you think this won't wipe out most VHF bands you
are mistaken. Weak signal work, particularly on 6M,
will no longer be possible. But heck, you won't care,
you can move to SHF!

Harmonics in the 6 meter and 2 meter band will probably be strong enough to
have a serious impact on VHF activities so yes it does affect you.  It will
affect commericial AM and FM radio reception. Your viewpoint is very
shortsighted.  In addition, better technologies than BPL exist for high
speed internet access.  BPL will NOT be cheaper than the existing high speed
technologies.

As far as code goes, it is unfortunate that the proper training methods are
not more widely known and so many people like yourself become unnecessarily
discouraged.  Using the correct methods and daily practice, one can get the
```

5wpm in 30 hours. See the book "The Art and Skill of Radiotelegraphy", which is available for downloading free off the internet. The principles discussed in this book are implemented in the free G4FON software, which can also be downloaded free from the internet.

Plus, even though I don't like the idea, it is likely that the code requirement will be dropped in the not too distant future (experts estimate two years or less). Thus access to HF will require only written tests. Do you want those bands wiped out when they are almost certainly going to be accessible to you in a relatively short time?

Are you so selfish as to want to see other's enjoyment of amateur radio seriously impacted? It is not the amateurs who make the regulations. All we can do is express our opinions. Sometimes the FCC heeds those opinions and sometimes they do not.

Hi Charles,

I was interested and depressed to read of the impact of the "broadband
over power line" interference tests done by the ARRL. Over here in
Britain there are having similar experiments and we are expecting
similar reactions from our government, as it has promised broadband
Internet access to all and sundry. As it seems that PLT (as it's known
here) may be the only method of delivering broadband to the public
```

(unless they force British Telecom (BT) into providing the service over their telephone lines, which is unlikely) so its introduction seems to be a foregone conclusion.

Today, the British government have announced that they will be carrying out a big environmental impact survey of (amongst a lot of other things) the effects on health of mobile phone base-station masts and high-voltage power lines that run near to homes. Now, I know these issues have been around for a long while and I won't go into the pros and cons, but given the general ignorance of the media and the public of the actual technical issues involved it would seem to me that a few hints of the unknown health impact of PLT in the home might be called for? After all, we are talking about wideband RF coming into every home and business, in fact anywhere there's a mains supply, and the effects on health of this are probably unknown. Of course, there is a downside to stirring up too much public concern on RF in the home environment and that is every radio amateur could end up with being accused of giving the neighbour's kids some life-threatening condition!

In the UK, all classes of amateur licence now have HF access in some form and the number of potentially-affected British hams has just increased considerably; the Europeans are pushing ahead with similar changes. If your FCC follow suit you may get more people prepared to stand up and try to get PLT blocked. I hope just there aren't too many "I'm all right, Jack!" types in the US like the poster who responded to you saying he won't miss HF!

Just my two pennyworth!
--

In article <9EYXa.9734$jg.2594579@news1.news.adelphia.net>, RaOuL says...

<snip>

> Take my advice, give up on HF too. It's a dying allocation with limited usefulness and only accessible by "elite" hams who can pass a test best left to dinosaurs.

It's attitudes like that which endanger the ENTIRE amateur radio service, not just HF allocations.

Were you around, sir, when, thanks largely to lobbying by UPS, half of the amateur 220MHz band was taken away? Did you know that UPS never did a bloody thing with that band, after fighting so hard for it? In fact, I don't know of ANY commercial radio service that's currently using that little 2MHz slice that the lobbyists fought so hard for.

Have you been asleep during the arguments about allegedly Part 15 RFID tags and other garbage that the FCC wants to allow in the 430MHz region?

How about the crap going on at 2.4GHz, with nine zillion types of cordless phones, wireless Internet, and Lord only knows what else?

I wonder if you'll be just as indifferent when commercial interests start sniffing around more of the 6m, 2m, and 70cm allocations? Trust me, they will, unless the amateur radio community, as a whole, stands up and says "No, we need those bands."

I also find it extremely difficult to believe that someone cannot copy 5 WPM Morse code. That's all that is required nowadays to get on HF. Not 13, not 20, not 10. Five lousy words per minute. My 88-year old father could copy that fast, fercryinoutloud!

I've never thought of myself as "elite." That's silly. I am, however, bloody proud of my efforts to win my first license (in 1977), and to upgrade to Extra in 2000. I may not have had to go through the high-speed CW test, but I can tell you that the written was no picnic, even for someone with my experience.

> I won't miss HF when it's gone, but I will enjoy the high speed internet access when it arrives!

If you had paid any attention at all in your studies of electronics and RF theory, you would know that BPL is a massive threat to HF allocations for EVERY SERVICE that uses them, not just amateur. We're talking international broadcast, aviation, marine, the works!

Tell you what; We won't miss you when you're gone, either. If you're so bloody interested in the Internet that you're willing to sacrifice a huge chunk of the entire HF spectrum to get it through a known-damaging technology, why in the Multiverse did you even bother to get your ham ticket?

Come to think of it, why don't you just go turn your ticket in and stick to the Internet which you are obviously so in love with? If you're truly as apathetic as you sound, I think the amateur service can easily do without you.

It would seem that "non-radio knowledgeable" consumers are the ones that BPL is aimed towards. These include the people that don't seem to know that their cell phones and cordless phones use radio signals. The same for Bluetooth or WiFi devices they might want to use inside their homes.

Sad to say but interference to the above devices would be more likely to gain attention than interference to something (hamming) that most people misunderstand.

I agree that we need to do what we can against this but has anything been done to test whether this technology will affect "in home" use of devices mentioned above?

Greetings and sorry for my lack of knowledge on the subject.
does anyone know of a website for some circuity information for the 802....
I am not interested in stealing ideas I just would like to know how the got onto 2.4 ghz.

Larry,

I would suggest that it is MUCH more practical and economical to buy
802.11b or 802.11b/g equipment ...

The 802.11 standards are HUGE and VERY complicated ... an any
practical implementation requires custom ASICs ... not a home-brew
project in any sense.

(I work for one of the world leaders in 802.11 ICs and modules, but
I am telling you straight, not trying to simply sell another NIC card ...)

73,
Carl - wk3c

p.s. If you'd like to browse the standards, they should be available
for free as .pdf downloads at http://standards.ieee.org/getieee802/

H Carl
Actually my curiosity is not that I want to build one but more that I would
like to know how they got the signal onto 2.4 ghz.  I am more interested in
the rf transmitter and receiver portions than in what they are using it for.
Larry

Most, if not all, modern chipsets that for 802.11b use direct conversion
to I and Q channels ... the major signal procesing is done at baseband.

For simpler, more general RF/IF needs, you might check out, for example,
the websites of
RF Microdevices http://www.rfmd.com
and
Maxim http://www.maxim-ic.com/

Hello,

in contrary, exactly your "elitist" CW attitude arm in arm
with your 88-year old father is holding back the needed
young blood from our hobby. One should think that now with
nearly all the world abandoning that antique mode requisite
you would be glad for any help in this deadly BPL matter,
but no, name calling again as ever.
This is the same in Germany, sadly to say, so kiss goodbye,
  shortwave AR, hello "Hinternet" (TM by ARRL)...

Hey there

I am trying to run SP 9.75 with my PK-232mbx with a prom from dec 93 and
can't seem to get it to
work right....all the other modes work....does someone have experiance with
this program and can

give me tips to make it work....

thanks

Hmm.. just looked at that.. $520? That's a bit more than I wanted to spend. I already have a KPC-3. I figured I could use that and buy a used 2m radio, probably for less than $100. The interface for a stand alone GPS unit is too complicated?

<< How does the GPS play into the whole thing? >>

If your Kantronics is V6 or higher, read the manual about connecting a GPS to it. It will 'share' a port on the TNC.

I have an old HT, a KPC-3 (V.8.3) and a Palm IIIc hooked to a RatShak GPS head (the one they closed out for $40) which works just fine. Using PocketAPRS, I get good tracks. Had used my Palm M515 but the serial port died....got the IIIc as it was quite cheap, in color and I consider it a "throwaway" unit. Bloody M515 is too expensive to risk.

Mounts? Look for the suction cup Palm mounts. Mine sits just over the dash on the LH side on the Grand Prix, quite readable using it for either APRS or just GPS. Cobbled up a charger cord/interface and feed both the Palm and the GPS off a 5V source.

Andrew

Ah, the smell of rosin core solder!

Looking at the manual, it says it's version 5.0. When I use the "version"
command, I get this:

KPC3-54CF3230-5.1

I am guessing this is version 5.1? Is there a firmware update to bring it to
6.0?

Hi!

I heard about a patch for the linux kernel to implement a frame
collector. The project I found was dead and was only implemented for the
2.2.x kernel.

Is there any other patch?

Thanks!

Michael

The usual scheme is that the GPS receiver feeds its data to the TNC (in my case, a Kantronics KPC-3+), and the TNC interfaces with the radio involved to move the data. APRS, as its name implies, is mainly for position reporting.

> Also, does anyone sell a Palm pilot mount for the car?

Have a look at http://www.smc-corp.com -- That's where I got my console mount and pedestals for the 'TechMobile' (http://www.bluefeathertech.com/kc7gr/thevan.html).

Choice of GPS receiver is entirely up to the individual's finances and requirements. I got lucky with a bunch of surplus hardware, and locating some good deals on OEM modules, and ended up investing a little under $250 for a fairly high-end GPS setup that's WAAS-enabled.

That figure included the antenna, which I got from a fellow who was selling them on Ebay a while back, and a DC injector (which was needed due to the antenna's bias voltage requirements -- 12V vs. 5).

HOWEVER -- keep in mind that my setup was built specifically for high accuracy in a mobile environment, and took a lot of work to put together. It uses an APRS-dedicated single-channel transceiver (a converted Motorola Mitrek).

In short: If you're looking for something in a handheld, my solution would not be a good one for you. ;-)

Good hunting.

But if I'm using a Palm Pilot, how does the Palm Pilot interface with the TNC? Do you need a splitter so both can plug into the TNC? Can you recommend a GPS unit that will do what I need? It's going to be a mobile setup, but doesn't need to be the top of the line.

You need a serial (RS232) port on the Palm Pilot. If it lacks such, or cannot be adapted to have one, you're pretty much SOL. In that case, you would probably need to look at using a laptop computer.

In short: You have a serial connection from the GPS device to the TNC. You have a second one from the TNC to the computer. The KPC-3+ can accomodate both, as it has two hardware serial ports.

Choice of GPS unit is, again, a very individual and subjective thing. I would suggest visiting http://www.gpscentral.ca -- they have a wide variety of units from all manufacturers, and you get to take advantage of the good exchange rate between US Dollars and Canadian. I bought my OEM module from them.

You need a serial (RS232) port on the Palm Pilot. If it lacks
such, or cannot be adapted to have one, you're pretty much SOL. >>

>If your Kantronics is V6 or higher, read the manual about connecting a GPS to
>it. It will 'share' a port on the TNC.

Heh...you'll have to give me the "Anton Squeegee" reference again....forgot the
ref. for that, but it rings a bell. Also, lovely use of Latin...who said it
was dead??

That said, all Palms up to but excepting the Zire have an RS232 serial port
built in (and there may be some newer ones which are USB only...not sure).

I've used a Palm IIIc, a IIIx, a M505, and my M515 for pocketAPRS use. I settled on the IIIc as I got it cheap and the wife complained when I "borrowed" her Palm for testing.

Mine is run using a hacked HotSync cable. Power is obtained from the 12V car system via a 5V regulated supply (love them cell phones...cheap/free parts!) hooked to the appropriate connections in the H/S cable. GPS is hooked to the TNC, the serial port of the TNC hooks to the Palm. Radio interface is off the TNC. All of this is right out of the book...no mystical incantations or dead chickens (other that what was in the sandwich, of course) (chicken, that is). SO!!

The power supply powers the RatShak GPS head via the unused fourth wire in the serial connection cable (uses an RJ11 cable ala telephone connector). This took a bit of hacking internally....just ran thru a diode the + lead to the unused fourth connector, wired the other end to the +5 for the Palm (actually 5.5V out, diodes for protection on both devices). TNC is under the seat along with the radio. Antenna is a $5 RatShak glassmount POBGF which works for this application. Data and power are run up to the Palm/GPS via one cable. 12V at the radio/TNC is connected to the PS for the Palm & GPS head.

Lost you yet? Unit works OK, with only 4W out (old Icom commercial HT) I have been able to maintain tracking around the small towns and cities here in central NC. Works great for ARES work, esp. when we have flooding/storms and folks want to see where you are located.

As for the TNC...you need at least V.6. Don't know if Kantronics has an upgrade....lemme dig thru my junkbox, thought I had a dead KPC-3 board with the later version ROM on it. To go the the "Plus" version you will have to upgrade the board....but V.6.0 will get you GPS connectivity.

Andrew

<snicker> Thank you! I was wondering if someone would ask me about that. Think 'Firesign Theater.' More specifically, their latest album 'All Things Firesign.' There's a track on there called "Everything You Know Is Wrong!" You'll need to listen to it to understand where I came up with Anton Squeegee.

As for the Latin: That's simply a quote from 'The Red Green Show,' a bit of Canadian comedy. Think of Red (aka Steve Smith) as the Canadian version of Tim Taylor, but with a beard and graying hair.

> That said, all Palms up to but excepting the Zire have an RS232 serial port built in (and there may be some newer ones which are USB only...not sure). I've used a Palm IIIc, a IIIx, a M505, and my M515 for pocketAPRS use. I settled on the IIIc as I got it cheap and the wife complained when I "borrowed" her Palm for testing.

They do? Good heavens... I had no idea. I always thought the docking station did some voltage-level shifting to make it talk to the PC's serial port.

> Mine is run using a hacked HotSync cable. Power is obtained from the 12V car system via a 5V regulated supply (love them cell phones...cheap/free parts!) hooked to the appropriate connections in the H/S cable. GPS is hooked to the TNC, the serial port of the TNC hooks to the Palm. Radio interface is off the TNC. All of this is right out of the book...no mystical incantations or dead chickens (other that what was in the sandwich, of course) (chicken, that is).
> SO!!

Well, congrats! I'm glad someone knew of an alternate solution.

There you are, VHFRadioBuff... All the help you need from someone who's actually done it.

I've looked into the IC-2100H in the past for use as a regular 2m mobile and
didn't like what I had read... Right now I am thinking of picking up an old
HTX-212 or an ADI rig. I'll look for the GPS and the Palm Pilot first since
used 2m rigs are a dime a dozen.

Yeah.  Figure the price of a 1200/9600 baud TNC and a dual-band
mobile and it's not a bad deal.  Never mind the fact it's
pre-assembled and functional when you get it.  You only really
have to make the cable from the GPS receiver to the TM-D700A.

Alternatively, the TH-D7 might be just the ticket.

> That's a bit more than I wanted to spend. I
> already have a KPC-3. I figured I could use that and buy a used 2m radio,

> complicated?

Not really.  It's just kinda cool not to have a bunch of stuff cobbled
together in the car, the reliability is probably much better for the
more integrated unit.  You can use the D700 while it's also running
APRS and so on.

A TH-D7 is an HT version and might be a better deal if you just
want to broadcast your location and speed all the time.

Let's look at used prices:

Old 2m mobile (Don't need a dualbander!): $50

KPC-3+: $125

$175+/- total vs $520 new for a dualband radio with built in TNC. Maybe if it had an integrated GPS, the $520 price tag would be worth it, or if it was my primary mobile rig.

<< <snicker> Thank you! I was wondering if someone would ask me about that. Think 'Firesign Theater.' More specifically, their latest album 'All Things Firesign.' There's a track on there called "Everything You Know Is Wrong!" You'll need to listen to it to understand where I came up with Anton Squeegee.

As for the Latin: That's simply a quote from 'The Red Green Show,' a bit of Canadian comedy. Think of Red (aka Steve Smith) as the Canadian version of Tim Taylor, but with a beard and graying hair. >>

Ah, yes....I'll have to check that out...ah, for the days when people actually USED their brains....and verbal spars and parries were witty, not profane. I have always agreed with Samuel Clemmons (Mark Twain) when he said that profanity was the last refuge of the weak mind.

And will check out the Red Green show next time I'm at our Montreal office....but I really don't watch much TV. As for the Palm/APRS solution, post here and I'll try to pull the details together to post, if one is interested.

Cheers!
Andrew

Fine rig, just don't use a non-resonant antenna (i.e., high VSWR) as the finals module could fail (like any rig!). I'm running a RatShak HTX-252 for APRS...it was free, albeit dead; took a few minutes to repair the problem (speaker wire pinched between the frame and board toasted a resistor in the audio circuit...so much for Chinese QC). If you get one, do the squelch mod, it works much better. A stock -252 works poorly. The -242 or the -212 are better selections and rather cheap.

Want solid? Look for the Icom non-PL units, the Kenwood non-PL units...both rock solid (don't drop one on your foot, either) and cheap. Either unit will last a long time.

A

In article <20030716030758.27389.00000446@mb-m19.aol.com>, VHFRadioBuff says...

> Does anyone have links to pictures of mobile APRS setups? I think I know how I
> want to set mine up, but I'd like to see pics of what other hams have done.

There's a lot more there than just my APRS radio, but...

http://www.bluefeathertech.com/kc7gr/thevan.html

The APRS transceiver, as mentioned earlier, is a converted Motorola Mitrek. You'll see it on the upper shelf, just below the power inverter. The Kantronics is secured to its topside with industrial-strength Velcro.

The GPS receiver is a Garmin-15 series OEM engine, in a mil-surplus housing, right next to the Mitrek. To the left of the Mitrek, barely visible in the shot, is a little DC injector (also called a 'Bias-Tee') that, in my case, was required to make my GPS antenna happy (it required 12V bias as opposed to the more usual 5V).

Said receiver has a single serial output that is dual-connected to both the TNC and computer. Seems to work pretty well.

Keep in mind that, based on what you've posted before, my setup is probably more effort than you would want to go to, especially where the onboard computer is concerned. However, you asked for pictures of APRS setups, soooo...... ;-)

Hi,
I've been following the thread and I missed what it is you are trying to
accomplish. If what you want to do is put a blip on an APRS map and
thats all then I suggest getting the TinyTrakIII.
http://www.byonics.com/tinytrak/.
It is simple to build, costs 40.00 bucks and interfaces with any KPC
product cable 16.00 http://www.packetradio.com/!TNCables/KV2RSRJ45.jpg
<http://www.packetradio.com/%21TNCables/KV2RSRJ45.jpg> (this one is for
the htx-212) you may already have a cable for the KPC that you own.
Buy an old rig, conect the tinytrack to the radio cable, connect the GPS
(used ETREX cheap) to the other end of the TinyTrack (standard GPS to
DB9 Serial connection) and turn it on. You are now putting an APRS
signal out on 144.390 simplex, No PL. I can now see you from my home in NJ.
If you want the GPS to work in the city or in a heavily wooded or Valley
area then you will need a GPS that has an external antenna connector on
it. Garmin GPSMAP 76 or Garmin 12XL. If you are getting a GPS anyway I
would suggest you bite the bullet and get the GPSMAP 76. Now you can see
where you are in the world on a selfcontained map on the GPS. No wires
hanging around to a PDA.

If what you want to do is more than that then spend the bucks and get
the Kenwood TM D700. That simple! Any other way you do it will put more
wires in your car than any wife will allow and my wife is a Ham. N2TVM
Have Fun
Please call if you need help. just drop me an email and ill send you the no.

http://www.IanThurston.com/radiogear

Kind of old pics, added new gear since then.
But the APRS is there. :)

Yes, available from Kantronics.  But they will give you the latest and
greatest version which is 8.3,  which does have GPS/APRS support.

One way to find your best first digi for a home station is to look at the APRS map. Look for the nearest digi "star" icon. In your area, a path of W6CX-3,WIDE or W6CX-3,WIDE1-1 would be better than starting with RELAY. You are correct that home stations should not use RELAY because it usually causes more dupes than are required.
Finding the closest WIDEn-N digi to name in a home station's path isn't automatic, but if you look at the map and watch the packets scroll by on your terminal screen for a while...
Hope this helps.
73, Cap KE6AFE

Jack wrote:
I have another question for you, Cap, which is slightly related to a message you sent to a mailing list but which also probably interests people outside that list. I would like to change my fixed home station's routing from RELAY,WIDE (which is bad but works) to specific stations. What is the best way to identify a good path? I'm hoping for something more sophisticated than "listen for stations that identify themselves as WIDE and that you can hear directly", but if that's the right answer, that's good to know.

Jack.

Granted. After reading the web site I did say "What the HAIL is he talkn' about", but then, we do like to dramatize, or be cute or clever when we talk/write, don't we.

On the other hand, After reading the OP I said to myself "What is it that makes people post critical comments out to the world instead of just asking the originator what was meant?" Seems like the latter would take less ink and solve the original problem. If a friend/brother/mother says something you don't understand, is the accepted response to go to the neighbor's and do some speculation about what was meant?

Besides, I think DigiPan is a pretty neat piece of work (do we even know what a Fourier transform is - much less how to program one) that these guys are providing the Ham community, free of charge and somebody is griping that the guy isn't an accomplished author. Sheesh! Lighten up folks and enjoy the fruits of their labour... or write your own.

So there... the pipe & smoke it thing.

Basically, the D700A TNC never sends an ack to an I-frame unless the I-frame has the Poll bit set. What this means is that the vast majority of other TNCs (as far as I can tell) will consistently send MAXFRAME number of frames to the D700, then time-out waiting for an ack, re-send the frames and set the Poll bit. It positively kills performance when using the D700 in connected mode to most BBSes and such.

The problem does not appear when talkign to other D7/D700s, since the D700 *always* sets the Poll bit on every frame and does not implement a deferred ack timer at all. This is less than optimal as well.

Of course, if you run in KISS mode and use a host-implemented AX.25 stack, this problem is avoided.

Since the D700 is really focused on APRS which is implemented using UI frames (datagrams), it's apparently not a critical issue.

Yes.

It's quite capable, and I'm trying to remember all the things it
can do. I've certainly used the ability to run packet on one side
and talk on the other several times and liked it a lot.

The manuals are available from Kenwood, look at:

http://www.kenwood.net/indexKenwood.cfm?do=SupportFileCategory&FileCatID=5

You'll want both the Instruction Manual *and* the Specialized Manual
(which covers all the digital features).

It's quite a versatile radio and is effectively much more than a TNC and a radio in one box. The APRS display and the ability to send messages using the microphone keypad (much like SMS on a phone) are good.

Dana

Anyone built Jonathons latest on a SuSE 8.1 box?

I got it going after a fashion by doing the following. Note that JT44 dies after a minute or so. FSK441 looks okay but havent seen any sigs yet!

- Dont install the wxGTK packages from the SuSE distrib. Download the latest source wxGTK-2.4.1.tar.gz and build it per the INSTALL info in the LinWSJT package.
- libsndfile is not installed in the SuSE default. It is however on the distrib CD/DVD. I also installed the develop package but dont know if it was needed.
- The FFT libraries are named differently under SuSE. I modified the Makefile in the LinWSJT root changing the export LIBS reference from -lfftw to -ldfftw
- Building takes a while. My P400 took about 40 minutes to do wxGTK and another 30 to do LinWSJT
- Note that I ran the configure/make etc processes as a normal user and then

su root to do install and ldconfig. I mention this because the root user doesnt get the path to the /usr/local area. Before doing make install add the /usr/local/bin temporarily to roots path so it can find wx-config.

I suspect the JT44 dying is a problem with fft libs. There is a comment on the fft source sight that says that the norm now is to prefix the single precision libraries with an "s" but leave the double precision w/out a prefix. The older method (and what is set up in SuSE 8.1) is to use both an "s" and "d" prefix and not have an prefixless library at all. Having said that I should point out that their is a prefixless fft header file in /lib/include that symlinks to the single precision library!

Am going to spend some time this weekend looking for signals to resolve. After that I'll create some symlinks for the prefixless libraries and change the header file around before trying a WSJT build again...

Cheers Bob VK2YQA

Hello all. There's a band opening right now, so I figured I'd fire up the TNC.
I'm on 50.620FM running a packet beacon. It'll be mostly unattended as I have
some other things to do, but please give it a listen if you have a TNC and send
me a message.

A packet is sent out once per minute, so please tune to the freq and wait at
least 1 minute before giving up. I an running an FT-100D at 50 watts with an
MFJ "double zep" antenna vertically polarized at 20 feet.

Fellow Amateur Radio Operators,

I have created a new list that deals specifically with legal issues pertaining to our hobby, the Amateur Radio Legal Issues List. The list is for the dissemination and discussion of legal issues (such as PRB-1 and pending legislation in Congress) and other related issues (court battles, etc.) that can affect our hobby.

If you are interested in such a list, please send a blank email to ARLI-subscribe@topica.com.

73's,
Paul Gray, N0JAA

Ummmm.... That's a great idea, but couldn't you have picked a list host that doesn't have a reputation as a spam supporter? I block traffic from the entire Topica domain at our servers for good reason.

Yahoo isn't much better... Could ARRL help, perhaps?

Good luck in any case.

Hello all:

I have been subscribed to the subject lists for a number of years though I rarely post messages. I did post one to the Kenwood list several weeks ago. A week later I send another one but it was not posted. I received a message several days later saying I was not subscribed. Note that I receive posted messages from list members daily. I unsubscribed & subscribed, send a message - same results. I sent a message to Larry Wilson describing my problems. He suggested that: "Probably you are subscribed under a different address, perhaps an alias." Not so, I use only one address for all my emails including the list. I send a message to the Yaesu list with the same results. The reply: ""Your attempt to post was rejected because you are not subscribed to this list (You can't post unless you are subscribed)." Can anyone help me?

Most Hams wouldn't do this because of the content restrictions on the bands. As long as you are willing to filter the data, then this is really no big deal.

Are your local Hams too poor to buy their own Internet connection?

You would probably be in violation of your ISP by doing this. Unless you have a commercial connection, they usually don't allow you to share (sub-let) your connection. They would probably terminate your contract.

What exactly are the Part 97 advantages?

I'd strongly starting with WiFi under Part 15 limitations, carefully reading the rules. You might find there aren't any Part 97 advantages in your case, only disadvantages, and Part 15 is just fine. Make sure your internet provider permits you to redistribute access in the TOS.

I'm speaking from experience here.

Dana K6JQ

Not a problem as long as everyone sticks to
the part 97 content requirements. Of course
if you do stick to those requirements, you will
probably not need the internet access part,
but just the Ham Radio links.

I'd like to try 2m packet. But how do I find a station that is doing
it? Is there a standard set of freqs to monitor?

I'm in northern michigan.

Thanks,

Wes, KC8SPR

Google.
Try "packet radio michigan".
Many web pages with info on packet radio in Michigan.
Listen on 144.91 - 145.09 ten KHz steps.

How can I find a list of 2-meter repeaters that link to the APRS
network? I looked in the ARRL repeater guide, but didn't see any
reference to APRS.

Dick

The invert command is "INVert ON or OFF" Default is OFF.
Here is the statement from the Kam Plus manual, While in the RTTY,
ASCII, or AMTOR mode, entering a <Ctrl-C>I directive will toggle the
inversion ON and OFF.

Regards,

James

Also the manual states that pin 4 on the KAM+ connects to the CW key
jack on your transceiver. When operating in CW, it will ground this
pin thru a 100 ohm resistor to key the radio. The radio must be set
to CW with the VOX turned ON and any electronic keyer turned OFF.
Essentially all the software is doing is turning a relay on and off in
the KAM+. Have you tried a HARD RESET on the KAM+, if not,
you might give that a try? Good Luck. 73's.

James

What is this Multimon thing expecting ?

Is it expecting ordinary asynchronous characters ?

```
>        // LSB first. Start bit MARK end bit SPACE
>        // MARK is 1, SPACE is 0

>        for (i = 0; i < 10; i++)

>                 bit = 0;
>                else
>                 bit =( a >> (i-1)) & 0x1;
```

In that case I assume you have mixed the polarity of the start and stop bits.

In ordinary RS-232 asynchronous communication the start bit is "0" SPACE, interrupting the idle MARK state, followed by the data bits with LSB sent first. The stop bit is "1" or MARK, which then transfers to a MARK idle state if no more characters are to be transmitted.

If that Multimon thing is expecting AX.25, don't forget to add the bit stuffing in the last stage before transmission.

Hmm.. shot one, for GCC, no ASM. Nominally targetted for 8515 at 8 mhz, easy to redo.

Not quite finished implementing, and definately not tested, but framework should be there.

Okay, I've figured some things out since I first posted. Multimon was written by Thomas Sailer, who also wrote the soundmodem program.

It's available at http://www.baycom.org/~tom/ham/linux/multimon.html.

Documentation is lacking, but reviewing the source (don't try and debug at 4 AM; I should've figured this out originally) the afsk1200 decoder expects hdlc encoding, and possibly AX.25 framing (didn't trace that far). However, an undocumented option -v 10 yields the raw bit stream.

> In that case I assume you have mixed the polarity of the start and

That part I figured out from APRS packets recorded off the air. Start is definately 1200 hz, stop is 2200 hz.

Thanks for the suggestions,
R C
KG4MVB

How did you determine this ?

APRS is definitively AX.25, which is a version of the X.25 protocol, which are all members of the HDLC protocol family. These protocols are _synchronous_ protocols, thus, they do not contain any start or stop bits. The AX.25 protocol sends 8 bit octets (bytes) packed immediately side by side without any bits in between them forming a multiple octet frame. The whole frame starts with on octet with the "01111110" bit pattern (the flag pattern) and it also ends with the same pattern (or a single flag is used as a _frame_ separators, if multiple frames are sent at once). In order to avoid false flag detection within the data part of the frame, the 0 bit is inserted after five consecutive 1 bits.

To illustrate how synchronous protocols work and how the bit stuffing is done in HDLC, here is a simplified example (use fixed font).

Assume that you want to send the characters "a?b" which is 0x61 0x3F 0x62. First convert to bits (LSB first)

```
10000110  = 'a'
11111100  = '?'
01000110  = 'b'
```

Put them side by side

```
100001101111110001000110
........^^^^^...........
```

Check for 5 consecutive 1 bits and add the bit stuffing.

```
1000011011111010001000110
_____________I___________
```

Add the flag octets

01111110100001101111101000100011001111110

It should be noted that the checking for five 1 bits must be done after the bytes are put into a single bit stream, since sending two consecutive bytes such as 00001111 11110000 do not violate the five1bit rule separately, but when the bytes are combined into a bit sequence, you would end up with 0000111111110000, bit stuffing must be inserted 00001111101110000. Sending 11111111 11111111 requires three stuff bits: 1111101111101111101

This a very simplified example, a real AX.25 frame would contain the address fields and the CRC field at the end.

When you say that the APRS frame starts with a Mark and ends with a Space, are you sure you are not seeing some effects of TxDelay, i.e. the Tx is on but no data (or some preamble) is sent.

Well, don't forget that HDLC is NRZI encoded - the absolute level
(mark vs. space) is meaningless. A transition indicates a 0 and
the lack of a transition indicates a 1. Sending a series of 0s
results in a square wave of 1/2 the baud rate (since each baud
is the opposite of the previous baud). Sending a series of 1s
results in a series of unchanged bauds.

So, if the initial state of the NRZI encoder is '1' and the
'01111110' flag sequence is sent, the resulting output is:

```
initial state 1 : 0 0 0 0 0 0 0 1 and the next flag looks like
                   0 0 0 0 0 0 0 1 and this pattern repeats as long
as flags are being sent.
```

If the initial state is 0 you get:

```
initial state 0 : 1 1 1 1 1 1 1 0 and this pattern repeats.
```

So, you can't tell anything about the date being sent
from the absolute levels.

Dana

Hi,

The WWW.DIGIPAN.NET shows a new version 1.7 is out. However, all 3
links are either bad, or error out. Any help on where to actually
find version 1.7?

I wasn't sure what the exact nature of the catastrophe was.... Maybe tracking down a final "bug" in the software? The explanation was a little bit cryptic, to say the least.

I thought that was weird about the PACTOR issue too... They complain about PACTOR stations - but the new version has recieve-only PACTOR added!

Is PACTOR recieve there for the sole purpose of obtaining the call of offending PACTOR stations so PSK31 users can whine about them? Personally, I have NEVER seen the bad behavior by PACTOR ops that the guy complains about, and I spend a good deal of time either monitoring the digital stuff, or on the air.

I don't have PACTOR capability here, but know that PACTOR stations perform a useful purpose for ALL hams, not just for a couple of keyboarders going at it.

I'll look into it... If these guys are out to harass PACTOR ops, they may find that they have bitten off more than they can chew. Sounds to me like they may have that old "we own this bit of spectrum" fantasy going. - But then again, the web-site I listed is so cryptic that it's hard to tell exactly WHAT they think they are are saying. It could be something else altogether.

Hard to say... Anybody have an idea what they are talking about?

Therein lies the problem I was having. I was looking at this as
another protocol layered on top of an asynchronous serial connection.

Thank you, it makes more sense now. Bitstuffing on a synchronous
serial
connection is trivial. Receiving is slightly less so, but not too
difficult.

I think I got the impression that bell 202 is asynchronous from some
of the commercial bell 202 modems I found on google; nearly all of
them say asynchronous. (Which, on reflection, is probably on the
computer<->modem interface.)

Caller ID _does_ use an asynchronous wireline format, and also uses
Bell 202 signaling. Okay.. so it can go either way, and hdlc is
synchronous.

It does indeed appear to be some sort of runout to keep the squelch
from closing too quickly, but the of end packet flag occurs approx. 32
bits before.

Thanks,
R C
KG4MVB
(In any case, telemetry is not required to be AX.25 encapsulated, but
it's nice for interoperation)

I am being paid by UC to do research in general. I would not receive compensation as a result of this specific research, so in my mind I have no pecuniary interest in the project.

> I would think that the University already has or can easily get non-amateur resources (both hardware and spectrum allocation) that would support your research projects. The challenging task is finding out who may have such resources. In addition to checking with the project lead faculty, you may need to check with the department head and the college dean. An often overlooked channel for information is contacting the purchasing persons at the department/college/campus levels. They know who requisitioned what. From there you can go to the requisitioners and find out what administrative activities they went through for licensing.

I will look into this suggestion. We are working with someone in another department who had to get an FCC license to use some VHF spectrum; either he didn't do his research or the UC doesn't have anything suitable.

The basic problem is that we want to place our sensors in areas where existing infrastructure is missing (no phone lines for example). We could buy satellite uplinks, but that would cost a lot of money.

It sounds like my idea is closest to violating 97.113(a)(5), i.e. regular communications that could be reasonably (albeit expensively) furnished through other radio services. What is your opinion, does cost factor into the "reasonableness" of alternative radio services?

S. Sampson wrote:

>>>Graduate students aren't considered employee's of a University.
>>
>> However, when I did my graduate research at UCLA 40+ years ago, the result was considered "for" the University, not for me as a private individual.
>
> I would put it this way: If the University intends to patent any part of the research, then the ARS should not be used.

I'll have to check on the patent issue. Our goal for this project, however, is wholly noncommercial. It would simply exist to facilitate research. And ultimate, it wouldn't use ARS. I'm just thinking about the first 1-3 years, when we are setting things up and experimenting, that ARS would be very suitable and (possibly) appropriate.

Thanks again for your valuable input!

Regards,

-Leo

I'll have my packet beacon running on 50.620 FM for a while today. Give a listen and see if you hear it/see it. I've got PacTerm running so I'll see any messages on the frequency.

Again, this is at 50 watts on my FT-100D with an MFJ "double zep" antenna vertically polarized at 20 feet.

[This message was reposted from eHam.net's APRS forum by the author]

I'm writing an APRS client in Ruby, so I've spent a lot of time staring at packets. I think I understand how RELAY works -- whatever station repeats RELAY packets replaces RELAY with their callsign. WIDE works the same way, but what about WIDEN-n? I've collected some packets with my AEA TNC to demonstrate my confusion.

```
KE6STH>W6CX-3*>WIDE>SWRRSR:'1PQ!68k/]"4%}Sione ke6sth@arrl.net
KE6STH>W6CX-3>W6CO-5*>SWRRSR:'1PQ!68k/]"4%}Sione ke6sth@arrl.net
```

In this case, WIDE is being replaced with W6CO-5 when that station repeats the packet. That makes perfect sense.

```
K6HG-9*>WIDE2-1>S7RURP:'2]1l sk/]"3q}
K6HG-9>WIDE2*>S7RURP:'2]1l sk/]"3q}
```

What station is repeating this packet? I can't tell. What's supposed to happen here?

```
KE6TIP-3*>WIDE4-3>APRS:!3757.24NN12218.40W#PHG4268/A=3D000850/SanPabloRidge=
,Richmond
KE6TIP-3*>WIDE4-2>APRS:!3757.24NN12218.40W#PHG4268/A=3D000850/SanPabloRidge=
,Richmond
```

This fascinates me. Why does the same station -- the originating station even -- repeat a packet and decrement the counter?

Help!
=2D --=20

```

Better to be a moron than a clueless top-poster.

Now then, I take it you disagree with my advice to the original poster.

My comments were not meant to offend those engaged [formerly or currently] in the professional practice of law (especially communications law) like Phil Kane. That said, my remarks stand.

WIDEN-n is a decrement counter. That is, if you put WIDE4-4 in your path, the first digi will decrement the count before relaying the packet, or WIDE4-3, then the next digi will be WIDE4-2. When a digipeater gets a packet that is fully decremented, it won't digipeat it (i.e., WIDE4-0).

This is off the top of my head. Check the spec file at TAPR web site.

Sure, I've seen WIDE2-1 turn into WIDE2, but that doesn't explain the behavior I saw.

SSampson> This is off the top of my head. Check the spec file at TAPR

What spec file? I couldn't find it in the APRS or the AX25 specs.

Jack.

This helped a lot as well, thanks. Just got my bitstuffing/nrzi/crc16
code working.

The ax.25 spec document appears to be wrong, at least in current
practice:
"2.2.8 Order of Bit Transmission

With the exception of the FCS field, all fields of an AX.25 frame
shall be sent with each octet's least-significant bit first. The FCS
shall be sent most-significant bit first."

The FCS is LSB like everything else in the packets I've decoded, by
hand or otherwise. Took me a while to figure out exactly why my crc16
was broken, though. :(

Callsign substitution when using RELAY and WIDE is probably not the norm.
>
>KE6STH>W6CX-3*>WIDE>SWRRSR:'1PQ!68k/]"4%}Sione ke6sth@arrl.net

>
>What station is repeating this packet? I can't tell. What's supposed
>to happen here?

There are two implementations of WIDEn-N -

1. (In Kantronics UIFLOOD terminology, this is ID.) The digipeating station decrements the SSID of the WIDEn-N alias, inserts its own callsign/alias, with the 'H' bit set, before the WIDEn-N, and removes any previous alias immediately before the WIDEn-N. The idea being that the callsign/alias of the last digipeater is shown. So, if DIGI1 and DIGI2 are two digis supporting WIDEn-N, and G4IDE sends a frame via WIDE3-3, you get this -

```
G4IDE>APRS,WIDE3-3:Hello world
G4IDE>APRS,DIGI1*,WIDE3-2:Hello world
G4IDE>APRS,DIGI2*,WIDE3-1:Hello world
```

2. (In Kantronics UIFLOOD terminology, this is NOID.) The digipeating station decrements the SSID of the WIDEn-N alias, it does not insert its own callsign/alias, or remove any previous alias. So, if DIGI1 and DIGI2 are two digis supporting WIDEn-N, and G4IDE sends a frame via WIDE3-3, you get this -

```
G4IDE>APRS,WIDE3-3:Hello world
G4IDE>APRS,WIDE3-2:Hello world
G4IDE>APRS,WIDE3-1:Hello world
```

Mixing the two can result in misleading information.

Ah! We sure do like to speculate, don't we. It's easy to ask. The email
address is right on their web page.

    I forgot to ask, so I won't post his text, but an email to one of the
developers (skip) said it was some printing bug and that he is now on the
air testing the fix. I then asked about Pactor, but haven't gotten the
reply yet.

Though not yet universal, callsign substitution is _quite_ common in my
area, where many are using Kantronics or PacComm TNCs.

> >K6HG-9*>WIDE2-1>S7RURP:'2]1l sk/]"3q}

These two packets were sent by a couple of high-elevation WIDEn-N
digipeaters on mountaintops ringing the SF Bay area.

> There are two implementations of WIDEn-N -
<snip>
> Mixing the two can result in misleading information.

NOID is far better for determining network topology, and is recommended.
This recommendation is by, not least of all, the Father of APRS, Bob WB4APR,
who worked with Kantronics to enable the WIDEn-N protocol in the first
place, and the guy whose idea WIDEn-N was.
http://www.dididahdahdidit.com/text/digis.txt (explanation)
http://www.dididahdahdidit.com/ (general APRS info)
Hope this helps.

[...]

Can you explain this behavior? I'm pretty sure the mobile station doesn't have a WIDE alias.

```
KB5WIA*>WIDE2-1>APRS:$GPGLL,3759.519,N,12218.458,W,232104,A*3A
KB5WIA*>WIDE2>APRS:$GPGLL,3759.519,N,12218.458,W,232104,A*3A
```

Roger> There are two implementations of WIDEn-N -

[...]

Roger> Mixing the two can result in misleading information.

Cap> NOID is far better for determining network topology, and is
Cap> recommended. This recommendation is by, not least of all, the
Cap> Father of APRS, Bob WB4APR, who worked with Kantronics to enable
Cap> the WIDEn-N protocol in the first place, and the guy whose idea
Cap> WIDEn-N was.

Bob asserts that it's more important to know where the station entered the network in order to estimate the station's position. I'm not sure I agree. However, I can get what I want by using TRACEn-N instead of WIDEn-N, so all is good.

I have another question for you, Cap, which is slightly related to a message you sent to a mailing list but which also probably interests people outside that list. I would like to change my fixed home station's routing from RELAY,WIDE (which is bad but works) to specific stations. What is the best way to identify a good path? I'm hoping for something more sophisticated than "listen for stations that identify themselves as WIDE and that you can hear directly", but if

```
that's the right answer, that's good to know.

Jack.

>KB5WIA*>WIDE2>APRS:$GPGLL,3759.519,N,12218.458,W,232104,A*3A

KB5WIA has sent a frame, presumably -
KB5WIA>APRS,WIDE2-2:Etc...
and it has been digipeated by two WIDEn-N digis.
```

The only slightly unusual thing about it is that most implementations of WIDEn-N, including Kantronics, will set the 'H' bit when the SSID is decremented to zero. With an AEA/Timewave TNC, which is what you appear to be using, the frame from the final WIDEn-N would be monitored as -

```
KB5WIA*>WIDE2*>APRS:$GPGLL,3759.519,N,12218.458,W,232104,A*3A
```

(the difference is the '*' after the WIDE2)

Sorry, typo. For a frame header decoded by an AEA/Timewave TNC, it
should of course have been -
KB5WIA>WIDE2*>APRS:$GPGLL,3759.519,N,12218.458,W,232104,A*3A

The main point being, that, as I said, most WIDEn-N digis set the 'H'

```
bit when the SSID is decremented to zero.

Right, but that's not what I saw, which is why I asked. If I had seen
that, I would have understood it to be what you explained.

Roger> The main point being, that, as I said, most WIDEn-N digis set
Roger> the 'H' bit when the SSID is decremented to zero.

I need to reread the AX25 spec until I understand all of the bits.

Jack.

Uh... Is there an Idiots Guide to APRS? I recently got a Knwd D700, it's really slick and I'm interested in learning more. I downloaded the spec and looked over the digi paper referenced on Jeff's site @ http://www.dididahdahdidit.com/text/digis.txt over in Woodstock (I'm nearby), but there is still many details assumed. It's all still over my head except for hooking up the GPS and using it. I'd like to gain an understanding of the basics. Should I understand packet first? A simple glossary of terms would be a good thing. I may just try to corner Jeff.

If you are doing this research project within the scope of your paid position, then you DO have a pecuniary interest, and Amateur Radio is not an appropriate communications medium.

On the other hand, a competent web-site should be able to stand on its own.
You shouldn't have to E-mail the web-master, asking what the heck the
web-site is supposed to be about.

There is a lot of discussion within AMSAT in regards to
University research satellites using amateur radio frequencies.

While these two links are satellite related they may
provide some insight into existing radio Rules and

Regulations for using the amateur radio frequencies
for research in general:

http://www.amsat.org/amsat/intro/using-ham-freqs.html

http://www.iaru.org/satellite/

These links are not the regulations. But they do point
to the details.

In article <_aKOa.26165$q42.22170@charlie.risq.qc.ca>, gervais says...

> hi all,i have 2 raid card,SCSI DAP960 to sell or trade.looking for a
> portable or a mobile in exchange

Ummm... I kinda hate to be the one to burst your bubble, but those cards aren't worth anywhere near the cost of any decent portable or mobile radio that I know of.

Some recent examples, as in completed auctions on E-pay, may be found here. http://makeashorterlink.com/?Q4D312C35

In summary, the DAC960's (there's no such thing as a "DAP960" that I know of) seem to be going for between $30 - $50, and even at $30 they're slow to move.

Good luck.

You'll typically find PSK63 in the upper 1500 hz of a PSK sub-band. On 20m,
for example, look between 14072.5 and 14074. I often call CQ on 14073, and
am often rewarded with a PSK63 QSO.

73,

Dave, AA6YQ

I have known hams who are employed as researchers, and the division
of what they do in other allocations (license-exempt/license-free
bands in some cases) and what they do in the amateur bands depends on
whether they are doing their own radio tinkering, or whether the work
is being developed for a research project that is sponsored (and hence
controlled or directed) by their employer.

For their radio interfaces for research projects at work, they used
non-amateur bands. Yet for projects that were purely self-interest,
self-directed, and only concerned radio communications, they did
experiements in the amateur bands (UHF and higher).

Hi nothing NEW about these softwares just plain and simple softwares for all modes which use a soundcard. PSK,MFSK,CW,RTTY,SSTV, etc. Plus circuits of interest etc.

Got a moment, take a look.

http://www.g3vfp.org/download.html

Keep smiling guys. I know its difficult to do these days :-)

de Dave G3VFP

Hello all. I am thinking of getting into APRS from the mobile and I was
wondering if anyone can suggest a good APRS rig. This would ONLY be used for
APRS and nothing else, so it doesn't have to be packed with the latest bells
and whistles. I am planing on using my KPC-3 with some sort of Palm device and
running PocketAPRS. Email replies are welcome.

Just get the cheapest Yaesu 2 meter mobile rig. They are usually cheaper
than anything else you can find. I took all my 80's junk and threw it into the
dumpster. That crap was more trouble than it was worth, and I don't want
someone else to suffer.

Just ignore the bells and whistles. It will increase the resale value in 10
years.

Hello all. I've been surfing the web, reading about APRS but I am confused
about one thing. How does the GPS play into the whole thing? Can anyone give me
a webpage with a good explanation of how everything links together (planing on
using a Handspring Visor Prism with my KPC-3 and a cheap 2m mobile rig)? If
anyone can suggest a specific GPS unit, that would be good. Email replies are
welcome.

Also, does anyone sell a Palm pilot mount for the car?

APRS is designed to report "positions." These positions are derived from
some kind of NMEA 0183 protocol device.

Any GPS that provides a serial output, NMEA 0193, and WGS 84 based position references would be acceptable. I like Garmin products.

Check out the Geko 301 (Wow!)

People in other parts of the world may use a different datum then WGS 84, and their position may not correlate well to U.S. based maps.

[GPS with WGS 84 datum and serial port NMEA]
[Data modulator]
[Radio]

Most people use a tracker device based on a one-chip PIC processor, and run that to a radio.

As people move around the tracker decodes the NMEA lat/lon/speed and/or altitude, and modulates the radio and signals the PTT.

So how does the GPS interface with the system? I know the Palm Pilot connects to the TNC and the TNC connects to the radio. Do you know of some good websites that explain more? I will check into the Geko 301.

Nah, it's all too hard. Do you have more time or more money? If you have a lot of time, then cobble stuff together. Otherwise, write a check and buy an APRS-integrated radio like a Kenwood TM-D700A. Just remember it's not suitable for ordinary connected-mode packet cause of a blatant bug, but it's a fine APRS radio.

I replaced the old PC I used to run packet with a newer one that has a
9-pin serial port. Will I run into difficulties using a 25->9 serial
converter with my AEA PK-232 TNC?

Jack.

Too short range.

Ya never know, someone might set up nearby
and then we could make the 13 cm. contact :-)

:) I guess it's too late this year to setup a proper ham radio setup for
802.11 unless someone out
there knows what can be done to have it qualify as a FD contact? Just change
the SSID's
to call signs?

If you run SNOS it is pretty simple :-)

Put the access point / router / ethernet bridge into
your IP subnet, use FD as the SSID, choose channel 6,
turn off encryption. SNOS will do the rest and will automagically
create IP, AX.25 and NET/ROM links between you and
any other system you can hear. Then use the usual
packet radio exchange. SNOS takes care of the ID issue.

Yes I've tested this and yes it works.

A 2 or 8 watt amplifier and gain antenna will help ...

Great! Thanks for the info. I visited your site and I'll have a look at
SNOS. Last time I played around with NOS was with JNOS and TNOS.
But I'll have a look at SNOS.

SNOS is a different thing than JNOS or TNOS.
The initial S is for "Simple" :-)

:) I just hope to have the time to play around with it before FD. I didn't
find JNOS or TNOS that hard to
play around with it after you spend a few weeks/months hacking at it :)

Yes ... exactly!

You could do the same thing with any of the *NOS software,
at least I think you could. The main issue would be automated
ip route discover ... don't think anyone else has implemented
ARP Poll and automatic arp/rip/route discovery yet.

Great! The easier the better, I don't have the time to play around with route tables.
Since this is last minute for field day, I was hope we could atleast do a 2.4ghz contact.

Set up two stations at the FD site?
Forgot details of rules ... perhaps that would not count :-)

Hello All,

I have uploaded TrueTTY 2.10 to the main site and mirror:

http://www.dxsoft.com/truetty.zip
http://www.truetty.com/truetty.zip

Best regards,
Sergei

Windows HAM radio software at http://www.dxsoft.com

==

TrueTTY Versions History

V2.10
The documentation was updated.
Auto-recognizing of callsigns and control numbers was improved in contest mode.
Some minor bugs were fixed.
V2.09
BPSK-31 decoder was changed again.
V2.08
PSK-31 filter bandwidth was changed again.
Phase indicator maximum width is limited to 92 pixels now.
Waterfall colors can be customized via "Setup / Waterfall" options now.
V2.06
Phase indicator was made for fine tuning in PSK-31.
It can be switched on or off via
"Setup / View / Show phase indicator in PSK-31" option.
V2.05
Buttons and hotkeys for fine tuning were made:
"Alt-<" , "Alt-Left" keystrokes and "<" button
move RX frequency to 1 Hz down;
"Alt->" , "Alt-Right" keystrokes and ">" button
move RX frequency to 1 Hz up;
"Alt-Down" keystroke and "<<" button move RX frequency to 5 Hz down;
"Alt-Up" keystroke and ">>" button move RX frequency to 5 Hz up.

```
V2.04
  BPSK-31 decoder quality was improved.
V2.03
  The "Setup / View / Spectrogram as waterfall" option
  or "Alt-W" hotkey switch spectrogram view to waterfall or
  ordinary spectrogram now.
V2.02
  A bug was fixed. COM-port speed was set incorrect when the same
  port was used for PTT-control and data exchange.
  Auto-recognizing of callsigns and control numbers was improved
  in contest mode.
[...]

One would be off the grounds of FD. But your right, I might be mistaken, of
course I would look into the rules.
So Tried SNOS last night and couldn't seem to get it going. Will it only
work with 98/95? I was trying on a XP laptop.

It only works with DOS.
It is an operating system, not an application program,
uses DOS to load then takes over the system.

Thank you very much... specialy the links from AMHAM73 help me a lot to
understand how does this work, and gave me an idea about what I need to
start... thank you all!!

```

Hi,

I have a World Access Radio made by American Electrola. The model number is, DXC-100. The company that made this all American radio back in 1993 has since gone out of business. They were located in Pittsburgh, PA. There were only a few hundred of these radio's made that I know of. This radio has a digitial read out and the display has failed on it so I cannot see what I'm tuning in on short wave or AM or FM. It also has a rear DIN-type connector for optical line level audio output, remote tape recorder on/off control, and computer interface. I do not know how to fix it and was wondering if anyone knows someone that is good at fixing radio's. I have digitial photo's of it if you need to see it. This has really been an excellant radio over all these years and I do not want to get another type. I have sort of grown attached to it if ya know what I mean. Thanks.

Greg D.

I did a Usenet search and found a post about using the DSP-232 in zero crossing mode as a "hamcomm" type interface. The post was rather old and the address of the originator no longer is good. Anyone have more information on this? Like what mod to select after the Modem has been selected?

rec.radio.amateur.digital.misc:7699

Hi,

What we'd like to do is use amateur radio for some university research projects. Specifically, we would like to use AR equipment in sensor network research. Sensor networks are basically like APRS without people at the transmit nodes, and more than just position information is reported (maybe temperature, etc). Also, multi-hop relay may be employed.

I've examined Part 97 rules and tried to read as many applicable threads as possible. My interpretation is that:

(a) automated transmissions are OK (with caveats)
(b) AR can be used for educational (non-commercial) purposes
(c) AR can be used for data transmissions, using encrypted authentication, provided the data payload is unencrypted

Part (b) is the most shaky becaues it seems to dependon "reasonable use" and other gray terms. Certainly my proposed use is not "hobby" but it seems to me to fall into the category of "experimentation" and (hopefully) "advancing the field."

What do you think of using AR bands for relaying sensor information for research purposes? Would an FCC Special Temporary Authority be appropriate/required?

Sincerely,

--

I don't see a problem with that, as research is what interests Amateurs.

If you don't use a specified code, you must identify using a specified code.
For example, if you design your own protocol (unspecified code), then you
should design the system to ID every 10 minutes, or every transmission.

> (b) AR can be used for educational (non-commercial) purposes

See below

> (c) AR can be used for data transmissions, using encrypted
> authentication, provided the data payload is unencrypted

Yes. Phil Karn proposed a DES authentication many years ago, however, I
don't see why just a plain old MD5 checksum of the data and the time-stamp
wouldn't fit most requirements.

> Part (b) is the most shaky becaues it seems to dependon "reasonable use"

> and other gray terms. Certainly my proposed use is not "hobby" but it

I don't see a problem in what you are proposing, and I think you could enlist several amateurs who wanted to help. It goes without saying, that you would need a ham license yourself, but that is pretty simple these days on a no-code ticket.

Even if the money you use to buy the equipment, and power the equipment, is grant money, it would be legal. Where you would begin to have problems, is if you made the data proprietary, or sold subscriptions/membership/access to say web sites where the data is stored. You could maintain a compilation type copyright, and restrict access to the raw data and software, if you provided say access to the processed data. I'm being vague, but the gist of it, is that you
can't make money, and I never heard of a research program that did.

73,

Steve

Do you have, or are you going to have, a ham license? Will all the stations involved have a ham licensee on hand? If not you will run into difficulties with the third party rules.

What you describe may fall under 'experimental'. But I would check with the FCC.

You may want to try Mr. Hollingsworth at FCC and see what he says. He is chief of enforcement, FCC. Or maybe he can direct you to the proper desk.

Keep us informed. This is interesting.

Riley (who has plenty on his plate as it is) is in the Enforcement Bureau, not the Wireless Telecomm Bureau that issues ham licenses and interprets the rules thereof. He would not be involved in such before-the-fact interpretations - it's the folks in Bill Cross' shop at WTB who issue interpretations as to whether such operation is permissible or not, and then Riley sees to the enforcement.

Off the top of my baldy bean, if there is any taint of remuneration or pecuniary interest, I would advise a ham client that it would not be permissable.

Then again, the wizards and wonders at the FCC's Office of Engineering Technology have been known to issue Experimental licenses for things which are the equivalent of attempts to mate a zebra with a tiger.

Contact Carl Huie <chuie@fcc.gov> who is a ham and the guy in OET who
handles such things.

How do you think Tommy Lott developed ACSB when the land-mobile
big-three folks turned him down flat and he did the "research" for
the wannabee companies? Can you say 20 meters ?

Lots of us knew what he was doing but nobody wanted to blow the
whistle. Shame on me.

Then again, best to let that "creation" stay dead.....it's been about
25 years, and it never caught on, primarily because the manufacturers
who did fall for that scheme could never get the equipment to work
properly.

That should not be a problem. I envisage we would use an unspecified
code for our data transmissions, but we could self-identify with an RTTY
broadcast every 10 min. This will all be computer-controlled so that
should be easy.

> Yes. Phil Karn proposed a DES authentication many years ago, however, I

Our motivation for authentication is that we are concerned with
controlling access to the sensor network; for instance, we want to be
the only ones who can give commands to the sensor nodes, like "turn off."

I should have mentioned, I have a NCT license: KD5SZT. Issued last
summer. That's a great idea, getting hams involved. I think it would be
a fun project.

Our goal is to provide a "service" to researchers; no compensation would
ever be accepted and the network is only for use in relaying sensor data
and sending commands to said sensors. Data produced would be freely
available. Sounds like our application is OK with the use policies.

Steve, thanks for your input!

Dan/W4NTI wrote:

I do have a NCT license. I can imagine getting my advisor to get a
license, but I'm interesting in seeing if I can get around that. As I
see it, there would be several autonomous transmitters (relay devices)
and one control station, all of which would be under my control. As I do
sleep some of the time, is that a problem? :)

> What you describe may fall under 'experimental'. But I would check

> FCC.

We want to design our system so that any manner of communication means
could be used to ferry the sensor data (internet, etc). But for our
initial experimentation, I think ham radio would be (a) very appropriate
and affordable and (b) fun. We will probably use ISM for short-range
communications and only rely on ham for longer range xmits.

Great, thanks for the reference. I will contact him.

Regards,

In article <bdvgma$88l$1@woodrow.ucdavis.edu>,
please_use_my_last_name@ieee.org says...

<snip>

> What do you think of using AR bands for relaying sensor information for
> research purposes? Would an FCC Special Temporary Authority be
> appropriate/required?

I think you need to get your Technician-class (or higher) ham license. That, at least, would be a good start.

I would say find a comercial frequency and use it. YOu did not mention the
frequency that you would be using . If under 30 mhz it will be would wide.
If in the UHF and above you may go ok. Just remember you will be subject
to a shared frequency and others may use that frequency.

Sounds like one way or beacon modes to me.

What does that mean? That his application is illegal, or you just don't want him to experiment on the Ham bands?

> You did not mention the frequency that you would be using .

The only frequency he could use would be VHF and shorter wavelengths, due to the automatic features he needs.

> If under 30 mhz it will be would wide.

World wide?? What does that have to do with anything?

> If in the UHF and above you may go ok. Just remember you will be subject
> to a shared frequency and others may use that frequency.

Duh... Although most VHF and UHF bands are about as empty as the U.S. treasury, and two people using the same frequency would be as likely as being hit with a metorite.

> Sounds like one way or beacon modes to me.

That's because you're very ignorant of the rules:

Section 97.113(c) prohibits transmission of "Communications in which the station licensee or control operator has a pecuniary interest, including communications on behalf of an employer."

Are you being employeed by UC to conduct university research projects?

I would think that the University already has or can easily get non-amateur resources (both hardware and spectrum allocation) that would support your research projects. The challenging task is finding out who may have such resources. In addition to checking with the project lead faculty, you may need to check with the department head and the college dean. An often overlooked channel for information is contacting the purchasing persons at the department/college/campus levels. They know who requisitioned what. From there you can go to the requisitioners and find out what administrative activities they went through for licensing.

Good luck,

Duane Allen

Yes, UC does have such resources, and the source of who has what
where throughout the UC system is the Office of the Vice President
of Administration, located on the UC Berkeley campus.

At least that's who we used to deal with concerning radio spectrum
assignment and licensing matters for the UC system.

However, when I did my graduate research at UCLA 40+ years ago, the
result was considered "for" the University, not for me as a private
individual.

I would put it this way: If the University intends to patent any part of the research, then the ARS should not be used.

I'm working on a telemetry board and wish to include software FSK1200 (MX-614's are getting harder to find). The official Bell 202 spec is out of print and hard to find as well, so I pieced this together from what I can find. Multimon won't decode the output, so I'm likely doing something wrong. This is supposed to be (once it works) my reference implementation before I port it to my telemetry board, so I'm trying to keep it as simple as possible.

The program outputs 22050 hz 8-bit signed data to stdout;
```
gcc fsk.c -o fsk -lm; ./fsk > test; sox -s -b -r 22050 test -w
```

test.wav

Phase is coherent, and there are peaks at 1200 and 2200 in the spectrum analysis.

Any help or suggestions would be appreciated.

Robert Cicconetti
KG4MVB

```
-- begin fsk.c --
#include <math.h>
#include <stdio.h>

// $#@$#@
//#define BAUDRATE      1200
// octet rate is 150 octet / sec. (1200 / 8). BIT period is
// .000666, or 1/1500 (10 bits per symbol, including start and stop).
// BAUDRATE is therefor used improperly here; fixme.
#define BAUDRATE        1500
#define MARK            1200

First - is multimon expecting a properly formatted AX.25 frame? (This code is clearly not creating an HDLC-encoded, AX.25-formatted frame). It looks like you're sending conventional async-encoded ASCII. You need to:

a) Create the AX.25 frame
b) HDLC-encode the AX.25 frame
c) Generate the checksum for the frame
d) send the resulting stream of bits using the modem

Also - I'd avoid the use of transcendental functions (sin()) in the synthesizer loop ; I'd create a lookup table and index it via an integer phase accumulator. Off the top of my head, I'd guess a 16-bit phase accumulator and a 256-element sine array would be plenty. You'd need to precalculate the phase increments for 1200 and 2200 Hz, likely as constants.

Good luck!
Dana

That would explain it. I hadn't planned on using AX-25 (TX is the
audio subcarrier of an FM ATV camera; no point in packetizing it since
no digipeaters would be able to hear it, and unit should never be out
of reception range in any case). I had planned on adding framing,
checksums and possibly FEC later.

I was also trying to keep it as simple as possible initially; encode
raw octets and make sure I can decode them.

It may be worth adding the HDLC/ax.25; initial basestation will likely
be a laptop running soundmodem.

That is step 2 :) The target CPU will most likely be a Mega8535 AVR,
so conversion to integer is definately indicated. :)

Thanks,
R C

I'm trying to get my Dad's Kam Plus working with his Ten-tec Omni-D. Weird problem: In CW mode, the keying is inverted. Turning the Ten-Tec to CW (usually works fine with straight key), the carrier comes ON solid, and is keyed OFF by the active times of an "O", for example.

The KAM "INV" command applies only to RTTY, ASCII / AMTOR.

What is going on here?? IsThere another KAM command I can't find???

This is supposed to be a plain Reed Relay contact.. I can't see how it can be inverted except in firmware somehow.

Any help, pointers, suggestions greatly appreciated.

Thanks es 73,

Terry King WB1FQH for N1UF

Join the Radio Society of Great Britain for �1.05 or 2 US dollars

Normal membership cost is �42.50 but if you join in July

with the RSGB special offer Membership will cost you �1.05

That�s a massive saving of �41.45 pounds!

For that you get one years membership of RSGB which includes the RSGB
national radio magazine Radcom.

Go to http://www.qsl.net/g3zhi/rsgb.jpg for the application form.

In which case, AX.25 isn't that hard at all to implement,

HDLC is fairly trivial, and the checksum code can be found
pretty readily (I have a Java port of something I sponged out
of an old RFC if you're looking for sample code).

You'll likely need it all for soundmodem recognize your frames, but
you don't need to do full-on connected-mode AX.25, UI datagrams are
likely enough.

Heh. You're tempting to cobble up the DDS code for giggles and
flash it into an atMega16 I have sitting here ;-)

Dana

Been a while since I owned a KAM, but I believe that there may be a physical jumper on the circuit board that selects normal or inverted CW keying. Sorry, no manual so I can't say which one, but it may be visually apparent by following the CW key line back through the circuit.

Fred King wrote:

So, you believe it is ok for here to screw other mothers out of something they had set aside for their children. Her actions show her as she is, a mean greedy person, thinking only of herself. What about those who bought the stock she sold only to find out the next day it's value had dropped. Should they eat the losses that the incurred when Martha sold them stock which she knew was bad?
Give her some time in jail, give her time to reflect on her actions.

Jim Simmons

I am trying to resurrect my old MFJ-1278 for packet use.
Fm Packet works great (send and receive) on two meters,
and I'm able to receive on HF. The problem I'm having is
that when I try to transmit on HF there is no transmit audio
and therefore no power output.

The setup on HF is as follows. The xcvr is connected to the
TNC as Radio 1 via the Data In/Out connector on the FT-847.
The PTT is wired separately to the xcvr and not via the
transmit audio line. When I attempt to connect to a station on HF,
everything appears to be working correctly, except there is no power
output. I've tried several terminal software packages - all with the
same results.

Has anyone successfully used the FT-847/MFJ-1278 combo on HF?
As far as I know, I have everything hooked up correctly as per
the xcvr and tnc manuals.

Any help would be greatly appreciated!

Norm, K2NF

Hi there,

Thanks very much for reading.

I have the following problem:

Config:
Laptop Armada 1700 ;

The programs that I have troubles with are MixW, ChromaPix, GetCW and Truetty.
I input a signal via the soundcard; signal is controlled by microphone input of mixer (there is just that input).
When I listen over the speakers it sounds ok to me.
But when I use it as an input, some programs seem not to respond toit, or the signal i see (waterfall or other graphic) is to soft (low).

I know the programs work ok, beacause on my desktop they do.

Does anyone have any idea what I can do?
Is there a hidden setting that can 'boost' the input or throughput?
Or is this often the case with laptop computers???

Any help is bery much appreciated.

Kees

 |
 |
```

I seem to remember that there is a setting somewhere within the sound card configuration, which allows you to increase the gain on the line-in socket. It is just a ticky box type.

Kees.

You need to check the advanced audio settings, and turn on the "Mic Boost" or "Mic Gain" by clicking the checkbox provided for this.

If you have a volume control icon (loudspeaker icon) in the task tray just to the left of the clock, right click it and choose "Open Volume Controls".
Now click Options and then Properties, then select Recording.
Make sure that Mic or Microphone box in the scrollable list of controls is checked, if not left click the box once to check it.
Now click OK and another set of volume sliders will appear.
Click the Advanced button under the microphone fader, and check that the gain or boost or whatever the manufacturer has called it is checked or selected.
Note that depending on the make / model of soundcard the Advanced button may or may not be under the Mic control fader.. it could be in the middle of the window under all the faders.

You can see the difference made immediately by leaving Mix or whichever program running, and turning the various settings on / off and adjusting the faders while watching the waterfall.

Not all soundcard drivers call the various controls and checkboxes by the same names, so you may have to apply a little guesswork or consult the help for the sound card.

My card is a Creative Soundblaster AWE64 Gold, and the setting names given are those used by Creative Labs.

If you do not have a volume control in your task tray, you can easily add it.
Go to Start > Settings > Control Panel (you may not have Settings, depends on your operating system, I use Windows 98).. once at Control Panel, find the Multimedia icon and double left click to open. About 1/3rd the way down the resultant dialogue (Windows XP) or at the bottom of the dialogue (Windows 98), you will see a checkbox labelled "Show volume control on the taskbar".. check the box and the loudspeaker icon will appear in your task bar near the clock. It will either be a yellow loudspeaker or a dark coloured loudspeaker depending on your operating system. You can then follow the steps above.

Finally, as it's a laptop, you may have to find out how to disable the built in microphone in order to use the external mic input. The laptop user manual will tell you how to do this.

Paul MW0CDO.

Norm,

The PKT port on the FT-847 is for FM. The DATA port is for SSB and AM. The same audio is available for RX from both ports.

So, you will need to move the TX audio and keying to the DATA port to work HF, or more accurately SSB. I am not familiar with your TNC, but if it is a 2 port unit, you may be able to run one port to the DATA and one to the PKT ports, and select accordingly.

Also, the radio has an overdrive protection and will shut down the audio if you hit it too hard. Since the DATA port requires much less drive that the PKT port under some circumstances, start low.

Good luck!

Alan

 self-indulgent tripe snipped (fat juvenile american weight loss
method that actually works!  Pass this along to 10 friends or bad luck
will happen to you within 3 years)

Such paranoia.  This sideways bike makes perfect sense for getting
on/off the moving sidewalks that carry us to our nuclear powered,
steam-driven aeromobiles.

you are not welcome!  Keep moving please....

Sorry can't help Brian. I'm running CWGET 1.35 on a 1GHz Athlon, 512Mb RAM without any problems.

I can recommend a little utility to close any windows that have stopped responding...its called WinKill (ver 2.0). Can't remember where I got it from now but its worth a hunt on the Net for it.

Have you tried the dxsoft chat room which is where the CWGet author hangs out. He's called Sergei and is usually very helpfull. Try the software website first:

http://www.dxsoft.com/

Regards

Chris

You all talking about that two wheeled thingy that has gyro's or
whatever in it to keep from tipping? I actually saw one of those going
down the street the other day. And he was on a major boulevard
also...Not a backstreet. Looked pretty neat to me. I had seen them on
TV when they first came out, but wasn't aware of the name. MK

Umm, did I miss something? Does this come with a TNC built in? If not, WHAT THE
HELL DOES THIS HAVE TO DO WITH HAM RADIO!?

** Read in Reverse **

Take a look at the Product Review guide lines published on the main Product Reviews page in the managers side bar.

Customer service issues/problems are not reviews of a product (QSL cards).   Note however that if a review does review the actual product comments regarding the manufacturer, vendor, etc. are OK. But the review should primarily be of a product.

eHam's Forum has an area "CompanyReviews" that is used for discussing pros/cons of dealing with vendors, manufacturers, etc.

After receiving this email from Phil, my review about Octavia was again removed.
So.. I read eham.net guidelines, and posted again.
It is very difficult to review a product, if you never received it in the first place.
Reviews should include from the time you spend your money to the point in time
where you actually receive the product. Most vendors charge your credit card
when the item ships, not at the time of purchase. If this was done I would have
had time to dispute this with my credit card company.

Hi Mark,

One and the same. $4950 (and chump change tax). I've seen several. It's bad enough to fight bike traffic on the sidewalk (probably a worse collision possibility). And then there are the jogger's lanes, walker's lanes....

The law is not settled out. Is it a motor vehicle? No, too small a motor so sidewalk is OK in some places; in other places any motor puts it in the street. Does it need proof of insurance? No in some places (not a motor vehicle), and yes in other places (clouded reasons, often). Can you park it on the sidewalk where they ban bikes? Can they operate on a bike path? Who has right of way? When they come to a curb, do they use the wheelchair breakout? If none exists, can they demand one be built? What is the ethic of using it indoors?

All of this exposes the outline of the need for an alternative transportation grid that carries very light weight vehicles in the same patterns of existing traffic without mixing them with 18 wheelers and soccer moms in SUV's or teenage kamikazes. Here in Seattle we have had to fight tooth and nail against the politicians to move the Monorail out of the city center and into general use (not necessarily lighter, but certainly grade separated). The politicians (both sides of the aisle) wanted "light" rail - whatever that means. They decided that connecting the city center to the airport was too expensive, so they put in a design for an end-of-the-line rail station one mile away and use (yeah, you guessed it) busses. Can you say full body security Xrays at each transfer?

Last week's papers had the option of showing the bushes on their
complimentary Segways or showing bush ii falling off his. Note that
mother Barbara walked the distance, literally. Anyone thinking of the
next cavalry charge into Tehran? Noble 600.

Eham reviews are about as fair and informative as the QST Product Reviews.
ANY publication or website that receives advertising $$$ from a vendor is
biased regardless of the vendor..........end of story. Plus, Eham will take
reviews and post them from every dim-wit that doesnt know a damn thing about
radios or electronics.

When's the last time you saw a scathing negative review about a Yaesu, Icom,
or Kenwood radio in QST?.............Like, never.

I don't know how fast they can go, but couldn't be too fast. I bet a bicycle could outrun one easy. So I think they should be considered along the same lines as a bicycle, and adhear to the same appx laws. If they come to a curb, too bad. Time to portage. About the same as when I'm kayaking down a river. If I come to a logjam, or dry spot, I can't demand the landowners build me a canal through the bad spot...Here in Texas, on many rivers, the landowners own the river halfway out, where it butts against the opposite landowners half of the river. As far as the segways on city streets, they better stay out of my way, same as a bike, or whatever. My f-250 will make a mess out of them if they dart in my path. MK

I should hope so. I reviewed the Elk Antenna 2m Log Periodic.

Ten-Tec offered to modify my RX-320, but doesn't offer any software to
decode DRM.  I'll wait...

It won't be popular for ham radio.  The ARRL would never allow it, and
their man at the FCC is going after the wideband SSB boys with a
vengeance.  The wideband SSB sounds great, but it isn't something that
will propagate across the Oceans.

DRM is a very wide-band mode, that is incompatible with morse code,
and thus a non-starter on the Ham bands.

The reason Hams want to use digital voice on HF, is that it can be
processed and decoded to it's original fidelity.  The trouble is, if you
start out with 2400 baud vocoders, then the best you can do is 2400
baud quality.  If you want it to sound like FM radio (15k baud), then
you need a lot of bandwidth, or a long file transfer that is played back
after reception (which would get boring after a few minutes, as there
could be no real conversations).

I don't see the ARRL supporting this, thus the FCC rules will never
change.

When I played around with Q15x25 mode, a wide digital mode, I found that it only performed well under very good, almost ideal band conditions. On a noisy HF band like 20meters, it didn't deliver noticably better throughput than 300 baud HF Packet.

Q15x25 utilizes 15 PSK streams at 88.333 baud each, for a combined throughput (under ideal conditions) of 2500 baud. The signal is so wide that it flirts around with being illegal.

So you end up with a signal that takes up between 8-9 times as much spectrum as 300 baud packet, and under most operating conditions does not give you any better throughput.

>
> DRM is a very wide-band mode, that is incompatible with morse code,
> and thus a non-starter on the Ham bands.

I don't know what makes you think that DRM is incompatable with CW... If you can send and interrupt a tone, you've got CW capability. Bet any DRM can do that!

Besides, I think you are a bit behind the times... We are very close now to CW being eliminated as a liscensing requirement, worldwide.

The problem with a very wide band mode on HF should be obvious... Because of the global "range" of HF, (as compared to VHF/UHF) it's spectrum is not so easy to share and recycle among many users.

At any given time, for example, there can be thousands of Hams around the world parked on 145.01 MHz for packet, all having point-to-point QSO's without interfering with each other because under most conditions, 2 meters is only good for 50-100 miles of range. Hams a couple of hundred miles away would never even know you were there, so you can recycle that same bit of spectrum for something else. Globally, that one spot on the dial can be used simultaneously by thousands of hams.

With HF, the story is of course very different. Two stations communicating on 14.0XX Mhz can pretty well tie up that bit of spectrum for half of the planet - or more! There is no way that that one bit of spectrum can be recycled and used by thousands of Hams at the same time.

For this reason, wide modes that take up to 8-10 times more bandwidth are not nearly as sensible and practical on HF as they are on VHF freqs or higher. When they take up 8-10 times as much bandwidth and do not deliver appreciably better performance, it gets to the point where it is both stupid and rude to utilize them.

PACTOR III is a wide digital mode that can offer impressive throughput... It only works because the controllers are close to $1,000.00 in price, which limits the number of PACTOR III stations on HF to a select few. - If PACTOR III were suddenly became cheap and thus popular, the FCC would have to crack down with new rules to limit or eliminate its use because a couple dozen PACTOR III stations could tie up digital end of 20 meters very easily, making it useless for any other purpose, worldwide.

In other words, you have to be willing to be an extreme spectrum hog, all for the dubious purpose of making it sound "like FM radio"... Yes, I can see why the ARRL and FCC would both frown on that kind of operating practise, especially on HF.

> I don't see the ARRL supporting this, thus the FCC rules will never

Excellent! Glad to hear that, for the reasons outlined above.

One can get the software (+/- 60 US $) from the original project group
at:

www.drmrx.org

They also tell you how you can modify Yeasu ; Drake ; Kenwood
ham-equipment.
The mods are very easy and cheap.
A kit is +/- 25 US $

Free DRM-sofware (under the GNU/GPL) can be obtained from rhe Darmstadt
University

www.tu-darmstadt.de/fb/et/uet/fgeut/mitarbeiter/vf/DRM/DRM.html

Brodcasts started with WARC 3

Hope this will be of any help

So it only goes to follow that my F-350
crew will make a mess of your F-250.

Let the games begin. :-)

The FCC, in recent years, seems less willing to follow the wishes of the ARRL than it used to be. The technical staff in the relevant bureau are mostly hams who know the issues, and they seem now to sometimes exercise their own judgment over that of the ARRL. I think the simplification of the license structure and the curtailment of the code requirement are cases in point.

That being said, I quit the ARRL over "punishment licensing" many years ago. I think the publishing company dominates the voluntary organization and sees to it that ARRL policy serves its ends.

I'm unlikely to dart in your path though. But dunno...It might be closer than you think if you are driving one of these new fangled jobs with thin metal and stamped parts. My f-250 is a 68. Thick metal and forged parts. And it's got a heavy utility bed and shell on it. Just the custom welded double deep "living room couch" rear bumper, which once had a crane mounted on it, will resist the aggressions of most vehicles if they sneak up behind me. Probably weighs about the same as a geo metro with a full tank of gas. But needless to say, I doubt I will want to play. My truck has no dents in it. I'd like to keep it that way.   :/ MK

Hi John,

I think it is even more basic than that. The majority of the effort by the ARRL is in their "incentive" license structures, contests, worked all something, and other ways to generate wallpaper; simply to make it possible for a few ambitions hams to show they are better than the average joe. Then they can look down their collective noses at those who don't have the latest certificates, logs full of 15 second contacts or stacks of fancy QSL postcards. This elitist strategy plays well with the publishing house, since they get to sell all the "tools", schedules and rules for those that want to play their silly games, and then print the scoreboard when each contest is done. At its core, it is simply a vanity publishing scam. We're probably just lucky that some of the books actually have value outside of their schemes.

Fortunately, the FCC staff has finally begun doing an end run around the ARRL and is starting to figure out what the hobby actually needs, not only to survive, but to grow. Let us hope they continue to find ways to improve it. If we get enought of that new blood coming in, the ARRL might even have to mend their ways and learn to contribute instead of being a parasite.

Bob McConnell

You are are probably thinking of the Internet-linked repeater systems, such as EchoLink... The FCC is extremely dubious about Internet-linked repeater systems, from what I hear, but the ARRL thinks that they are good for the hobby.

If the FCC is making an "end run" around the ARRL as you say, then stand by to see Internet repeater linking go the way of the dodo.

I have heard of some program for packet called MSYS (or something really close to that) and was wondering if others use that program?

What are your opinions in regards to that program?

Would you recommend that program and why or what program do you think serves better?

Thanks in advance,

Hi Ryan,

I use MSYS Exclusively at this point on my two BBS's I sysop... I Sysop W9QYQ and N9LYA .... I do plan on running WINFBB next month also ... So I can run Pactor II... Right now I have four HF rigs running Packet here and one at W9QYQ along with VHF and UHF Ports.

W8AKF in California, got me hooked on it about 6 years ago.. From 1991 til 1996 I was a Packet user.. I used a BBS In Indianapolis.. that ran MSYS... It was Great.. In 1996 I Moved to Mitchell IN and started Sysopping W9QYQ .. Using MSYS.. Then setup ports at my house...

It can do all kinda of stuff... It is Y2K compliant.. It was upgraded on 1-4-2000... MSYS120beta4... Do not let the beta bother ya.. It has been determined to be bug free...

I wish I could tell ya more but so much to tell ya.. Best bet is to read the documentation... For features...

I would be glad to help ya setup

What are your interests..?? VHF HF TCPIP???

Here is a few links to our websites and a ferw others just for info...

Hi Charles,

No, I'm thinking of the code free tech license, followed by reducing
the number of license levels to three, reducing the CW requirement to
a more reasonable level in preparation for dropping it altogether, and
adding the FRS band for a useful, limited range, but license free
introduction to two way radio. How many of these were done over the
objections of the ARRL?

Sorry, no Internet supporter here for you to troll. I prefer PSK31, at
least until I have room to put some TTY equipment.

The FCC has no interest in seeing the amateur radio hobby grow. They are simply an administrative department to manage the usage and allocation of frequencies among all the users. If anything, their interest could be expected to lie in getting hams out of the hobby so they could justify taking away our frequencies and auctioning them off to the highest bidder.

The number of hams continues to grow faster than the general population. Why so many people have the misguided notion that ham radio is dying is beyond comprehension. The data simply does not support the "dying off" of ham radio.

Every activity needs an organized lobby to be effective in communicating the desires of their members to the government and trying to get favorable regulations and legislation. ARRL is the only organization to perform this function for amateur radio operators. The new blood will turn to the only organization around that can act as a strong voice in putting the concerns of amateurs before the government.

If you think ARRL is a parasite, then go form an effective lobby on your own. Odds are you will fail. If you don't want to form your own, then jump into the ARRL, run for the offices and GET INVOLVED.

2 meter Packet. I already have a program for my Baycom (yes, I know it sucks, but will have better later on.) packet modem, but was wondering if there were better choices out there. It is also the Michigan District 3 ARPSC recommendation for emergency packet comm's from what I understand.

The FCC in general probably fits that description. But the are
currently enough hams on the staff that they are making a difference.
Maybe we should ask our congress critters to mandate a higher
percentage of hams be hired.

Are you looking at numbers from before or after the no-code license
was introduced? I believe it was only after that the numbers started
to grow.

Sorry, I'm a technician, not a politician, which is the only
personality that can get elected or get results in any organization

larger than five people. I believe the ARRL is beyond repair due to
the entrenched special interests that control the board and elections.
I had hoped that W5YI would develop a viable organization, but that's
not likely to happen.

If you have ever thought of changing careers to make more money and would
like to work from home, now is the time.

We are an International Marketing Company that is looking for select
individuals in the United States and Canada, who would like to start their
own home-based
business using the power of the Internet and Mail Order.

No special skills are required. We provide everything you need including personalized training in your area. All that is required is a computer, access to the Internet, and the ability to follow directions.

INCOME POTENTIAL
$700 / week part-time
to over $8,650+ / month full-time

In order for you to make this kind of income we MUST work personally with you to show you exactly how it's done. Therefore, we are only able to work with a limited amount of people in each area. Once we feel that this limit has been met we WILL NOT accept any more requests. Don't miss out!

I see a lot about gateways, but nothing on using Ham frequencies for
internet access. Is this still illegal? Is the FCC considering allowing it ?

The difference between a commercial entity, and an amateur one, is that
a commercial entity is not restricted in content (other than state and
federal prohibitions/contraband).

Illegal?
Not in the US. Never has been illegal.
But you do have to be careful about what you transmit.

```

My packet radio setup:
HP notebook running WinXPHome (Omnibook XE3-GF without serial port) connected via the USB to Serial port converter MT-608-2 as originally supplied by HP to my TNC-2c with 6PACK ROM.

I had had Flexnet working on an earlier computer with a real serial port, so I knew how to set it up.
Using the original HP supplied drivers for the USB to Serial converter I couldn't get Flexnet to work, so I tried other ways.
After some experimenting I did get packet radio working again with my new computer but only using the AGW Packet Engine and of course changing the ROM in the TNC-2c back to the original TF2.7b (in KISS mode).

Recently, while looking for more information about this converter device and possibly a more recent driver for it than the one HP provides, I stumbled on some surprising information which convinced me the MT-608-2 is actually a device made by a company FTDI.

The most recent driver for the FTDI USB to Serial converter was quickly found here:
http://www.ftdichip.com/FTDriver.htm#VCP
http://www.ftdichip.com/

I installed the new FTDI driver, version 1.0.2115.0, and found the setup continued to work with AGW PE.
Today I went back to Flexnet and 6PACK in the TNC and using this newest driver I found that the serial connection now works OK with Flexnet as well!

Perhaps this information helps other Omnibook users.

Hey stoner---

I have facts. Facts from personal, everyday
experience.

Where are your FACTS that say my
experiences weren't/aren't real?

Idiot.

Where are your FACTS that prove driver
distraction does not contribute to accidents,
injuries, or deaths?

Moron.

I certainly don't listen to some bozo moron like yourself claiming: "If there are no facts posted, the situation does not exist."

It is a FACT that paying attention to something other than driving creates the FACT that you are no longer paying 100% attention on driving.

Show the world a fact that shows 100% minus an arbitrary number other than a negative or zero still equals 100%.

Fool.

I'm waiting for you to claim that the paperman cause the sun to rise in the morning, as the only logical argument you have made is one of "post hoc, ergo propter hoc."

> Idiot.

> Moron.

> Fool.

Typical responses from someone who knows they've lost the real argument, but insist on flailing about in a pathetic attempt at redemption.

The credibility of your argument is readily apparent.

There was no argument. Hams should have no exemption from
killing people with their cars, etc, while talking on a radio. You
can't argue with facts.

Ah, yes, amusing to watch you drag in the strawman, stage left.

My statement was clear; anyone with intelligence could grasp
it. Now, you, who has no leg to stand on, drags in the illogical
so as to "win" the argument. Not very educated, are you?

Take a poll. Who here in this ng thinks you have any solidity
to your claims? Hello? McFly???

Idiot.

Moron.

I will restate for the challenged:
ANY distraction, while operating a multi-ton motor
vehicle, is a danger, risk, and full blown contributor to
accidents and "accidental" deaths.

Blather on, dude, blather on...

> The credibility of your argument is readily apparent.

Are you talking to me, or YOU?!?

> Mark

Fool.

I'd like to see some pertinent facts.

Two-way radio communication in cars has been going on much longer than car cellphone use. I haven't seen any publicized study on the effects of using two-way radio devices on driving safety.

I'd be surprised if the two-way radios have no effect on driver attention. I'd also be surprised if they have as great an effect as cell phone use.

Before you tell me I just want to kill slightly fewer people than cell phone users, let's get some perspective by comparing both of these activities to other common distractions such as eating while driving, complex sound systems, quieter interiors preventing the driver from hearing emergency vehicle sirens, and say, desperately trying to get some decent music on the radio in a Clear Channel Communications-controlled world.

Hmmm. I'm think I'm onto something ...

"Your honor, my client's defense is that Clear Channel shares part of the blame for my client mowing down those school crossing guards like the 7-10 split. If they didn't program all the stations in town with their lame-a$$ formats, he would not have had to reach down and fiddle with the radio dial so often ... "

A simple check with Google would have shown there hasn't been a
discussion about digital modes here for at least 15 years.

I downloaded the MFSK16 AKA Stream software last weekend, to
liven-up my HF listening pleasure. This mode has been around for a
number of years, and I didn't know if anyone was still using it.

http://www.qsl.net/zl1bpu/MFSK/

I tuned my radio to 14.080 and just left it there for about an hour. Then
I heard the distinctive warble sound and quickly tuned it in. It was two
stations in Utah and Pennsylvania talking to each other. This was with a
coil of wire behind my seat, because I was too lazy to climb the roof and
hook-up my K4ABT dipole.

A funny thing happened. The waterfall display had faded away and I couldn't hear the warble, but I was still getting text displayed!

About the only bad thing I can say about it, is that it comes-in with little character bursts. These bursts start to go on my nerves after about 15 minutes :-) If I was the author, I'd rewrite the output code to make it more like one character at a time. Since this is a keyboard mode, the early arrival of characters isn't important.

If you have your soundcard hooked-up, you should give it a try.

Go to:

http://www.elcom.gr/sv2agw/inst.htm

Click on the AGWPE.zip download. I use this all the time, and it works
just fine. I keep the input audio as low as possible, and it decodes real
nice. I use the Rascal Interface by K4ABT:

http://www.packetradio.com/psk31.html

The AGWPE programmer interface is pretty simple as well, as I was playing
with a MySQL web interface program to throw APRS data into a database.
I haven't messed with that in awhile though, as I pretty much just got tired
of looking at the same old icons year after year :-)

http://groups.yahoo.com/group/SV2AGW/files/Programming/Linux%20AGW%20to%20MySQL/

Do you mean that you keep the volume on your radio low
or is this an adjustment on your computer?

Thx,

Talie

In my case, since I'm supposed to have powered speakers, but I never plug them in, I keep my computer volume control to max, and mostly use the mute control if it drives me nuts. Then I adjust my radio audio so the spectrum shows the signal with a bit of dynamic range (maybe a 1/4" of power amplitude) with the mic gain set to max, and then use mic gain to fine tune the whole thing.

I am about to purchase a used olympus d-490, and when I asked if the person had any problems with it, he said no, except for the lens mechanism that spends some 5 seconds still doing something after I close the cover and the lense hides itself.. so if I understood him correctly, after I try to close the cover and shut down the cam, the lense retracts completely and then, when it hits bottom, it still makes noise and possibly moves a little bit (sideways or slightly up and down), and then after it shuts down completely.

what I would like to know, before I get this cam, is whether this is normal for this cam, or is it a defect from manufacturer. the person said it's been doing this since he bought it new some 15 months ago.

thanks.

Am I the only one who sees the irony?

Not only is it ok to fly an aircraft while talking on the radio, but it's expected and encouraged and even mandatory in some airspaces. Similar behavior is expected with a yacht of any decent size.

The difference is very simple: These activities emphasize piloting over chatting.

People do all sorts of stupid things while driving down the road. This is an attempt to legislate responsibility and good behavior. It's nothing but "feel good" legislation.

New studies are beginning to show that the number one killer after drunk driving is: (drum roll) DRIVER FATIGUE! Driving while talking on the cell phone is actually pretty far down on the list.

What we really need to reduce the accident rate is responsibility and accountability. Everything else is puffery.

My MFJ1274 TNC is sick and I need hints to get it
going again. At power
on, the usual LED sequence does not occur. All 3
LEDs, STA CONM and PWR
stay lighted forever, not normal.

I managed to insert the TNC2 EPROM in backwards,
EMBARRASED, so I am
certain it is bad. It is marked marked TNC2
version 1.2.7 -32K.
Both MFJ 1270 and 1274 TNCs use this TNC2 EPROM.

I have my original EPROM, V1.1.7, that was used
with 16K RAM. Somehow, I
need a test EPROM to see if I can get this TNC to
boot correctly again.
I'd rather use a test EPROM than spend $20 only to
find the TNC will not
work even with a new EPROM.

Will my OLD TNC2 version 1.1.7 EPROM work with
32KRAM? Do I need to
change any jumpers to make this
old EPROM work with 32K RAM?

Thanks, 73, W6MIK, Dave

Version 1.1.4 and later require 32K of SRAM. If the TNC was formerly
used with an earlier version and 16K (8K chips at U24 and U25), cut the

trace between the center and one end pad of JMP12 and add a jumper from
the center to the other end pad. A 43256C-15L is installed at U25 and
U24 is not used.

I guess you could compare the two, if aviation density was
multiplied by fifty or so (2 planes per mile, to over 50 planes
per mile).

You can day-dream for quite awhile when the chances of someone
being in your 3 dimensional space, as opposed to the two dimensional
space of ground transportation.

Just my amateur opinion.

Steve

Hi,

Any old AMTOR users remember what software the AEA AMT-1 terminal unit used? I know there was dedicated stuff for the later AMT-3 but was there such a thing for the -1 or did it just use a dumb terminal program?

73,

That would be like comparing apples and potatoes.
Two totally different creatures.
And I'm neither an average motorist (I used to drive an ambulance in NYC)
nor a pilot.

Just getting started in the digital radio game again after 15 years, or so, QRT.

Got my old PK-232 to run with my Linux box (Mandrake 9.1). Just now, I'm using "minicom" to talk to the thing.

Are there any terminal software packages available specificly for the PK-232 and LINUX?

KPSK is great, but are there any programs available for AMTOR, Pactor, RTTY, etc., using the sound card on Linux?

Thanks a bunch, 73

Harv/AI9NL

My D490 makes no sounds after the cover is closed.

I suspect foul play - or a binary loop, neither of which are good

Many folks, thanks for helpful suggestions.
My TNC is coming back to life.

Dave VanHorn wrote:

>
> With all power disconnected, take the SRAM backup battery out, put the eprom
> back in (the right way) then put the SRAM battery back in, and power up.
>
> The settings are stored in the SRAM, and you may have gotten trash data in
> there.

Changed to oldest CPU and oldest EPROM,
version 1.1.7, and defeated battery backup
as suggested.

Now the TNC sends the greeting message
to screen and keyboard commands do control
TNC. I can start CAL and produce tones, and list parameters.

But now the COM1 paramters have changed.
Was 8 bit, now 7.
Was no parity, now even.

Did the change back to old EPROM
cause COM1 paramters to change?

The XR2211 output will not switch, is only
a DC level as I adjust R79. Is either
-5volts or +5volts.

Any other causes besides a bad XR11 IC?
Electrolytic caps in the XR2211 decoder are suspect, but their values are very small

```
     so do not suspect dry electrolytics to be cause of failure.

     I welcome suggestions.
     Thank you, 73, W6MIK, Dave

Yes.  7E1 is the default in the standard TNC EPROMs.

I'm repairing my damaged MFJ1274 TNC and find it will not complete the CALIBRATE procedure. The CAL procedure I am using is located at

http://www.packetradio.com/1270algn.htm

Apparently in the tone generation area, both MFJ1270 and 1274 are identical. Suggestions from MFJ1270 owners will apply to solving my problems.

I canset tones to 1200 and 2200 Hz in VHF and also to 1600 and 1800Hz in HF mode in 'single tone mode' up through step 12.

Step 13 thru 15, 'double tone' mode [1600/1800Hz] [1200/2200] fails to create
a square wave output from the U20 XR2211 'FSK decoder' IC. In 'double tone' CAL
mode XR2206 FSK Generator chip generate an alternating tone [1600/1800 or 1200/2200 Hz].

My TNC is driving the FSK generator and asking the the tones to jump between 1600/1800 Hz under control of 100USEC squarewave into pin 9 of U16.
50USEC at 1600Hz and 50USEC at 1800 HZ.

My XR2206 U16 will NOT produce two tones when driven
by this 100USEC signal, just a single tone.
But U16 DOES switch tones when commanded by CAL pressing the SPACEBAR.
U16 fails to generate double tones when drive by fast sq wave signal.

Failing to send two tones to U20 XR2211 is why the required SQ wave is not being generated during 'double tone CAL' procedure.

What is the timing of the FSK SQ wave on U16 XR2206 PIN 9
on a good working MFJ1270/1274 in double tone CAL mode?

What is the shape and timing of U16 XR2206 pin 11 VCO output
during 'double tone mode'?

Do I have a failing XR2206 IC?

After setting Decode Threshold pot,
my TNC2 now decodes AX25 packets into readable clear text.

Thanks for any help.

73, W6MIK, Dave

I had a few games including the original Adventure game of them running
off of an OpenVMS host in the middle 90s in middle Tennesee, aside from
a few staged demos, they were ignored.

Unfortunately most of the users of the demos did not realize that the game they were playing was actually on a computer several miles away.

In Hamscope, you had the option of transmitting on one frequency, and receiving on another, but in Digipan, you apparently do not, or at least its not as in your face about it as Hamscope is.

My question is :

For normal QSO's with people on PSK31, wouldn't I always want to transmit and receive on the same frequency?

Thanks,
KE4RCA

Normally TX and RX on the same freq, but a DXpedition might work split to
avoid a massive pileup.

Hi

I recently picked up a (really) old KAM with version 2 firmware, and would like to know the following:

As my primary use for the KAM will be for RTTY in a dual-receive configuration with MMTTY, will updating the firmware provide any benefit?

If the answer is "yes", what's the highest code rev. I can install without having to add any optional boards?

Does anyone have EPROM images for the KAM? I just need the file; I have the means to program the chip. Kantronics has already informed me that they no longer support this unit.

Thanks - Al, K2ZN

I find that CWGET stops after a few minutes and that attempting to
do "end task" does not work - I get 'not responding' and have
to reboot. I am running (or trying to run) version 1.36.

I recently replaced Windows NT with Windows 2000 on a machine which
is a few years old. The clock frequency is about 500 MHz and there
should be enough memory. I can find the exact details if necessary.

Any ideas?

Brian LA0DG

Thanks Jim!

I finally had the sense to try out the parallel port using a printer. And it didn't work there either. I ended up doing like you say, configuring the parallel port in the BIOS to use a fixed address.

So for posterity's sake, here is what I am using and how it goes together:

1) working sound card - in my case it's a built-in to the motherboard of this 333 mhz dell machine
2) compiled kernel with mkiss.o module
3) downloaded and compiled user-level soundmodem code (version 0.7)
4) downloaded libax25, ax25-apps, ax25-tools from sourceforge
5) downloaded aprsdigi and xastir
6) Configured and compiled all of that stuff. The compile for

aprsdigi didn't work until I did some fooling around with
/usr/include/linux/rose.h and /usr/include/linux/ax25.h,
namely, replacing them with links to ../netrose/rose.h, and
(I think) ../netax25/ax25.h something like that. and I had
to add the definition for AX25_MTU from the old /usr/include/linux
version of ax25.h   (I'm not sure if I have that all exactly right,
if it builds for you, then just go for it. If not, then it is
pretty
obvious what is wrong.)

7) run soundmodemconfig, create channels for each of the ax25 devices
you
want to use sm0, sm1, etc. Also, check out the scope display to
see if your
volume is set right. And test the PTT.

8) I linked /usr/local/etc/ax25 to /etc/ax25 (I may have done this
earlier)

9) edit /etc/ax25/axports to have a callsign/port for each channel
defined
in 7. The names sm0, sm1, etc. don't appear in axports file. But
we are building some callsign/ax25 definitions that will get hooked up
to sm0, sm1, etc. later.

10) run soundconfig -v5 and watch the packets come in

11) ifconfig sm0 up

12) axparms -setcall sm0 <callsign from axports>

13) aprsdigi (pointed to the ax25 port name indicated as the first
item in a axports definition line for callsign used in step 12)

14) ifconfig sm1 up

15) axparms -setcall sm1 <callsign from axports>

16) xastir - setup to use ax25 using ax25 name from axports which is
associated with the callsign used in step 15.

So the axports file relates callsign and ax25 port name. The
soundmodem config
relates callsign and network device (sm0, etc.) for each channel:

```
net device -->  callsign --> ax25 port
sm0 -> kc0atc -> digi (used by aprsdigi)
sm1 -> kc0atc-2 -> xastir (used by xastir)
```

Using mkiss the same stuff shows up as input on both ports, so
both xastir and aprsdigi get to see it.

It took me a long time to get this all figured out.

I am using parport0 as my PTT trigger. It is working ok.
I built the little PTT circuit from Sailor's web page.
Once I got my parallel port working, then the PTT and GND
lines from his circuit go to 0 ohms (PTT is grounded)
when the software wants to transmit.

(Isn't the internet cool? I can type all of this in and Google
Groups will keep it for all of posterity. If I forget, I can
just look it up!)

Chris

If you can swing it, Kantronics puts out a
GPS Tracker which is a KPC-3P with
8.3 Firmware, and a BUILT-IN Garmin
12 GPS Receiver. It's a little wider than
a standard KPC-3, but you just wire it to
the radio like you normally would, and you
are ready to rock'n'roll. I have a picture
at http://www.IanThurston.com/radiogear/RadioPA.jpg
and http://www.IanThurston.com/radiogear/220GPS.jpg

My layout in the truck has changed a bit, but it's
nearly still the same. I have the Tracker on the
nat'l APRS frequency using a Yaesu FT-1500M.

A couple of days go, I was trying to hook up a packet link between two computers using ethernet. I was doing a little bit of head-scratching, until I remembered an article I had written on the subject seven or eight years ago, and had put in my personal web-site.

I brought up the browser, clicked the mouse a few times, and there was all the info I needed!

Charles, N5PVL

Hello--

I have an Alinco DR-570 2m/70cm radio that, when transmitting on high power, the display will dim to arond 50% brightness, and the power output meter will quickly go full scale, then drop to zero, then go full scale--repeatedly.

I believe that the radio is trying to protect itself from damage.

On low power, all seems well, except that the display dims more than I seem to remember it dimming during transmit.

Does anyone have knowledge of a good place to send it for analysis and/or repair? It is approx 10 years old, so I have to consider the cost of a new radio over the cost of repairing this one.

Thanks for any helpful input!

Clif--

You are 100% correct.

I took your advice, and looked more closely at the cabling,
and sure enough, I used a power pigtail that appeared to be
the same guage as my other red/black power cables, except
it wasn't...the insulation was just thicker.

Thanks for the heads-up.

This should be enough motivation for me to solder on all of
the Anderson PowerPole connectors I received, and do it
to the kit's heavy guage wire.

Thanks, and 73.

How are you powering your radio? If from an AC power supply, you may
have a failing power supply. Your display's brightness shouldn't
change at all regardless of your transmit power setting.

73, Sam

I realize you found the problem, but the answer to your question is:

http://www.therfshop.com/

I also have a DR-570, and Randy fixed my dead display.

Randy does FAST quality work. He had my radio back before
I even missed it.

These cute little suckers would be ideal for portable packet purposes. I have a laptop I use when needed, but these guys are too neat looking to pass up, but they run WinCE. These devices link to PC's using the PC's serial cable, and I assume a proprietary connection on the MobilePro side.

Can these be used for Packet Radio? Do they have a terminal program? I would assume I'd have to use a null modem adapter to link to the TNC, since the device expects a DTE (PC) device on the other end.

And can they run DOS programs such as paKet or KaGold?   Is there an emulator for them?

Just wondering if anyone has ever tried it.

Thanks in advance,
-Ian, KE6CBL

I recently bought a kodak 4230 easyshare... took about 400-500 pics on the crv3 kodak battery.. I suppose it's dead now cause the battery turns itself on every now and then, takes a pic and then jams on me, and I cannot shut it down or do anything else unless I let it sit for a few minutes.

so I tried to buy a couple of alkaline batteries but the same thing happened.

can someone tell me whether brand new alkaline AA batteries can be just as bad and have the same effect as an almost dead crv3 battery when I put them in? it sure looks like it, unless of course there is a problem with my camera.

can someone tell me what the best batteries are for my kodak?   I am thinking of buying 2 AA rechargable lithiums (energizer) with the charger for around $40 canadian dollars.   is there a problem when buying non kodak rechargable batteries? and what would be the difference between 2 AA rechargables and one rechargable battery pack? thanks for any input.

Greetings Jane,

I would consider getting the accessory battery charger. If you do not want to get a dock, you might want to consider getting the travel kit. This gives you a battery charger that works on 100 - 240 and features several adapters for the diverse plug configurations you may encounter around the world. It also provides a nice carry bag with shoulder strap and smaller bag for other items. It will quickly charge the NiMH battery that is also included with the travel kit (about 3 hours or so) and you can use over and over. Just one purchase.

If not of interest to you, consider getting another CRV3 battery. It is a lithium battery and will last a long time.

Digital cameras require a specific amount of power, and though Alkaline batteries are pretty good for most things, they may note be able to provide the power levels that a camera requires. So, we recommend the lithium or NiMH rechargeables to give you those higher levels and in the NiMH the ability to recharge saving you a lot of money in the long run.

Talk to you soon, Jane, let me know if you have questions.

Ron Baird
Kodak

According to the following, hams are able to use SUPER EIRP on 802.11g:

http://www.qsl.net/kb9mwr/projects/wireless/pwr.html

Is this true? And, if so, why in the hell aren't we taking advantage of this?

Who said we weren't? (Of course, clueless Stu did!)

Yes, there are things that we can do with 802.11 stuff that exceed Part 15's limitations and remain legal for us licensed "few" (relative to the population as a whole - >0.3%) as long as we abide by Part 97 (meaning that we are restricted to those parts of the bands where these devices overlap with amateur privileges).

That means:

- content restrictions (including some third-party restrictions)
- ID'ing every 10 minutes when the link is in use.
- Automatic power control for PEP in excess of 1W (100W PEP maximum).

These are all the things that the average, unlicensed person doesn't have to worry about. However, they then have no such restrictions - only distance (due to their ERP limitations).

Get some of the MINH batteries and a charger.  The others usually will not
have enough power for a digital cam.  The MiNh batteries have a property of
being able to supply a very short pulse of high intensity power (current)
the cams need for a pix.  Other types of batteries will not do this very
well, but will last a long time in a flashlight or other device.  The MiNh
batteries will run down by their selves if not used in about a month or
less.  This is no real big problem , you just have to make sure you charge
them before you get ready for a pix session.  I have a cam that uses 2
batteries so I have 6 batteries .  I lable 2 each of them 1,2,3 and rotate
them in them order.  That way I usually have a charged set ready.

1.    Part 97 limits content
2.    Higher power doesn't mean better
3.    Part 15 is good enough
4.    Higher power sending BBS out-of-band mods is not
as much fun as sending pictures of naked women at frugal power.
5.    802.11 is spread spectrum.  I don't know where you could
say it wasn't, and get higher power allowances.

STILL having trouble with the commute, eh?  Now, could you try to
focus on the issue at hand for a few seconds, please...

>    - Automatic power control for PEP in excess of 1W (100W PEP maximum).

Go to the site and check the table for the 802.11g entry; it lists a
top limit of 1500 watts PEP (per 93.313), and an astronomical EIRP
limit.  My original question is in reference to these figures.

To pussies...

But what does this really have to do with my question regarding SUPER
EIRP? It seems that you REALLY didn't read the table, did you?

> 2.   Higher power doesn't mean better

I'm more interested in antenna gain (but that, of course effects
EIRP).

> 3.   Part 15 is good enough

Bullshit.

> 4.   Higher power sending BBS out-of-band mods is not
> as much fun as sending pictures of naked women at frugal power.

Maybe, but I still want better comm range than Part 15 provides...
hell, we can run super high-gain omnis on 802.11g, according to the
info from the table.

> 5.   802.11 is spread spectrum. I don't know where you could
> say it wasn't, and get higher power allowances.

Ah - so we FINALLY get back to the question from my original post...
the table in the link said that 802.11g is NOT spread spectrum (at
least for purposes of the rules, as interpreted by KB9MWR) - that was
the WHOLE POINT of my question... do you have a comment in regards to
this? (Let's try to stay on topic, for once).

Oh heavens. To think I was about to join this thread and
point out that ODFM is quite likely *not* spread-spectrum,
supporting your point of view.

Thanks for saving me the trouble.

Dana

I reread the draft. 802.11g is not spread spectrum when using the OFDM
modes, thus the spread spectrum restrictions don't apply.

So I guess the user has control of which mode the modem is in? I can
flip a bit and be in OFDM mode only?

802.11b is Direct Sequence Spread Spectrun, which is allowed under part 97
rules. 802.11g is OFDM, a type of multi-tone carrier modulation technique.
Is that even legal under current amateur rules? Not a statement, just a
question.

I always have trouble with 2.201 of the FCC rules, but in this case, I believe OFDM would be J2D?? But, in any case, 97.305 allows multiplex emissions, and unspecified codes in the 13cm band that have J1D, J2D, J7D, or J9D modes. I'm just guessing here, but I seem to recall that only TDMA data is a hated Amateur mode :-)

okay.. thanks for the advice.  I will get some Nimh batteries and a
charger...

what would be the best buy for my kodak?  greenpower batteries, duracell or
kodak?  they all vary in prices, but I'm not sure about performance.
thanks.

Never was any software for programming the V-100.  Programming the
V-100 can only be done with the EX-494 , cloning from a H-16 or
cloning from another V-100. To clone from another V-100 an EX-494 was
also required.

That info is wrong. Spread Spectrum is limited to 100W PEP (47 CFR 97.311(g)).
Only modes which use a single carrier frequency (suppressed or not) have the
1,500W limit (i.e. not on "two or more channels").

He's wrong.  The IEEE specification indicates that 802.11g physical layer 1 is
DIRECT SEQUENCE SPREAD SPECTRUM.  Your source from that web site has stuck his
antenna up his rear while transmitting a few too many times.

Yes, run off and hide under the bed - we wouldn't want any HAMS using the INTERNET now, would we? I'll tell you what, I'll use the Internet the way I feel like it, and you just sit there and complain and try to figure out ways hams CAN'T use it, OK?

With all the new low-cost/ubiquitous/reasonably-performing Part 15 stuff becoming widely available, it is almost a moot point anyway, as hams effectively have ZERO advantage over Part 15 users when considering realistic cost-effective implementations.

There are now companies selling low cost 19dBi Plate antennas that will hold various ubiquitous/low-cost APs in a weatherproof container in their bellies, so that we don't have to worry about feedline loss... turnkey 802.11b solutions for $120!... When compared to this - most Hams don't have JACK over wise Part 15 users... You nay-saying hams are stuck in the late-80's, you have got to be the epitomy of the of defination of a "technological throwback" when it comes to all things relating to RF-based Internet usage... it's like you guys are AFRAID... SCARED... PUSSIES. It's unbelievable. What do you think? That the Internet or Part 15 is just going to go away?! HA!

Look, it you don't want to use the Internet over RF, FINE... but what is with the HOLY CRUSADE against anyone else who wants to use it? HELLOOOO! It's 2003, not 1993!

Don't look now - but I'm a HAM, using the INTERNET! Oh my GOD! We can't have any of THAT! Better call up Riley Holingsworth QUICK!

IDIOTS.

- Stewart (N0MHS)

97.313(b) has no reference to emission type. All legal emissions may operate
up to this power level, unless restricted elsewhere (for example para c through h,
and spread spectrum limitations put forward by the ARRL).

There's no need for emotional outbursts. This isn't something
any of us will lose any sleep over. Just grab your belt hooks and
breath deeply.

While it is true you can take electronics from other regulated
services, you have to measure the advantage. As I see it, the
low power spread spectrum users would only be negatively
affected by a new neighbor with more power. I hope that Hams
will not destroy the 13 cm band, just because they can.

Go with the battery with the highest MAH rating that is milli amp hour. They should be in the neighborhood of 1700 to 1800 mah.

As long as you don't operate a 70's style repeater, or operate the 60's style
phone
bands on HF, you will be invisible to him.  Riley is a creature of the ARRL's
phone
complaint system, and not the microwave part of the radio hobby.  His recent war
against the wide sidebanders (who could use wide AM if he pisses them off) who
aren't harming anyone (i.e., having fun), and is typical ARRL "phone-herd"
inspiration.
Thankfully, they are dropping dead in significant numbers, and the ARRL might have
to start finding post-phone/morse era leadership to stay in business.

it's not green power, sorry.. it's emerging power... :)
and those have 2100mah on them...  charger plus 4 batteries = 70$CAN...
duracel charger with 2 (1800mah) batteries is $40CAN...  I think i'll stick
with the latter.

well, thanks for all yer advice.  I just hope it's not my camera that's
defective, because it really doesn't work when I put in brand new alkalines.
oh well, I guess the new NiMH will  let me  find out for sure.

Only a total dweeb would break the law for the dubious purpose of setting up Internet access over Ham Radio frequencies.

Amazing how the ignorance of these kind of losers is always accompanied by overweaning arrogance, along with an obvious dislike for Ham Radio and Hams.

An insect just begging for the sole of Ham Radio's shoe.

Here, I'll explain so you can understand it. Your needlessly
confrontational stance and especially your choice of gratuitiously
vulgar language are the issue (not your, or my, opinion about the
use of ham radio for internet).

Dana

Sorry, Dana, but its the other way round with me. I think his readiness to violate the FCC regs is much more significant than his lack of intelligence or basic social skills.

I will admit though, that if you believe that his lack of intelligence and basic social skills may have been a contributing factor in his disregard for the FCC regs, then you've probably got a good point there.

I've noticed the same lack of intelligence and basic social skills very often among the "Ham-Radio Internet" crowd... I think it's a prerequisite for membership, though there will always be mavericks like yourself.

There is no difference. We all want special rights, but the facts
are that over 50,000 people (mostly kids in the backseat) die,
and at least double that number are injured every year. That's
over 900 a week. If we lost that many Army troops in Iraq,
we would have to use WMD to survive.

There is no basic right to kill your neighbors while using your
radio. Get a hands-free adapter, and become a responsible,
caring driver. Even single-occupant emergency vehicles need
to use these, as they also are part of the mayhem.

We can let the lawyers work it out after the death, or have the
cops work it out with citations before someone gets splashed.
Spend a day at the morgue, then decide whether 18 dead a
week, in each state, is an acceptable loss.

You are claiming that over 50,000 people a year, including over
25,000 children, are killed due to automobile accidents caused
by using handheld microphones (cell phone, radio, etc.). Is that
correct? I don't believe it. Please provide authoritative references
for this claim. I assume you're referring to the US.

The facts are not what you claim them to be.

1998, Automobile deaths, ages 0-14: 2,568 (source:
http://rpc.senate.gov/~rpc/releases/1999/gc1083100.htm)

TOTAL estimated automobile deaths for 2001: 42,116. (source: http://www-nrd.nhtsa.dot.gov/pdf/nrd-30/NCSA/TSF2001/2001overview.pdf) In fact, the yearly
total from 1991 through 2001 never exceeded 43,000. An even more
telling metric is the number of deaths per million vehicle miles
travelled, as it take into account the number of cars on the road
and the length of their travels. That number has been consistently
falling, from 1.91 in 1991 to 1.52 in 2001, a time when cell phone
usage has greatly increased.

In 2001, children 0-14 represented approximately 5% of those deaths,
certainly not grounds for the statement "mostly children." That
percentage is remarkable consistent from 1991-2001. (source: http://www-nrd.nhtsa.dot.gov/pdf/nrd-30/NCSA/TSF2001/2001children.pdf)

The NHTSA doesn't provide statistics (that I could find) related
to deaths caused by use of hand held microphones, but it's reasonable
to assume that it is some small fraction of the totals.

So, given that you have obviously not done the research, and have
fabricated statistics to support your case, we must conclude
that you have some agenda in regard to this matter which is unrelated
to facts.

Yes, actually the money from the tickets goes to the basement
lounge of every police department, and we must protect those
lounges by arresting Hams.

Thank you for the clear admission that you've have deliberately lied.
That fact will be used when reading any further posts from you.

Thank you for the clear admission that expediency and your personal
convenience mean more to you than the lives of innocent children.

That fact will be used when reading any further posts from you.

Why pick on cell phone users or radio operators when the single biggest element in accidents is alcohol? The last time I saw statistics on this (which admittedly was some time ago) over half of all accidents/deaths were alcohol related.

Since distracted driving is generally illegal anyway, there is no need for a specific law aimed at cell phones or radio operators.

As has already been demonstrated, there is no factual basis for your statements. No authoritative evidence (actually, none at all) has been presented that even a single innocent child has died from use of hand held microphones while driving.

I suspect you're just a grumpy old fart who likes to complain.

AHEM Bullsh1t *AHEM*   "Demonstration", "evidence", my left one...!

I am a Ham, a cellphone user, a GPS user, a map-reader, a food eater, etc. when driving.
ANY distraction, while operating a multi-ton motor vehicle, is a danger, risk, and full blown contributor to accidents and "accidental" deaths.

At least I admit it.

But any specific ban, such as cellphone or hand-held device usage is lame. Bozos shave, and bimbos put on makeup while driving. Some read the paper. For that brief moment, the dropped french fry, or the incoming call becomes priority number one, and the lives and safety of those I may be putting at risk, including my own, suddenly fall out of the utmost importance....shoot, even a dog has more survival smarts than that!

A driver inattentiveness law would be nice, but it should be more of a "driver willful and knowing blatant disregard" law.

And, if guilty, that law should include me as well.

In article <biegdvsqsbmjgt1hhn9lo0lr7b0kq0s3hv@4ax.com>, kg-six-nhl@barovelli.com says...

> http://www.bayarea.com/mld/mercurynews/news/5975717.htm
>
> When it happened in New York I ignored any comments - heck I was not even licensed then - about how someone looking to hand out tickets would not see any difference from a cellphone user and a ham using a HT.
>
> Any comments on the latest assault on one's rights?

First off; using ham radio is a privilege, not a right.

Second; check the article headline again. "Assembly OKs ban on driving while calling -- except with headset, speaker."

The keywords here are "except with headset, speaker." This makes a -lot- of sense, considering that the idea is not to tie up one hand by having to plaster an object to one's face.

If you're going to use an HT while you're driving, at least use a remote speaker/mic or (ideally) a headset. Most modern ham HT's can be easily equipped for such, as can many of the commercial units (Motorola in particular).

While I understand that setting precedents in legislation can be a problem, I've had far too many close calls here at home (Puget Sound region) from brainless drivers who think their cellphone chat (without any sort of handsfree gear) is more important than paying attention to the road around them. If I were still living in California (I grew up in the Bay Area), I would be hard-pressed to oppose this bill.

When I did my own mobile install, with multiple radios and a cellphone, hands-free capability was part of the design from the word 'Go!' Besides the phone's hands-free cradle, I also installed an aircraft-surplus audio panel which allows me to use a speaker or headset for any of the three radios (HF, VHF, UHF). I've not had to use a hand mic ever since.

Considering the availability of surplus hardware, I don't see why this same trick couldn't be duplicated on other installations. This "assault on our rights," as you put it, is nothing more than a response to irresponsible people endangering themselves and others on the road.

Hello,

I am looking for one or two Flea Market Spaces at Hamvention.
If you can't make it this year, please let me know what you want for them.

Thanks,

Keith LaBorde, K4KAL

>every packet frequency known to the 2m band! :)
>
>-IanCT/KE6CBL

Actually, I don't use the FT-100D only for packet. I mainly use it for 6m/2m/70cm SSB. There's a DX cluster and a local Packet BBS that I like to log onto, so the FT-100D is useful. Since I posted this, I decided to use my VX-5R on packet. Both the DX cluster and the BBS are close enough that I get a good strong signal with the whip antenna on the HT inside my shack. I just ordered the packet cable for it.

Hello FM,

I've just starded to introduce myself into the Packet Radio's world.
I've purchased a Kantronics KPC3 (second hand). Got also a piece of cable with 4 wires, one mindi din male connector and a 9 pin RS232 male connector. Solder & diagrams

TNC 9 PIN SERIAL	RIG (Icom 2725) MINI DIN	
3	3	Transmit audio (AFSK)
1	1	PTT Push to Talk
5	5	Receive Audio
6	2	Ground.

Done.

As i plug the serial plug into my KPC3, the rig it start transmitting.
Even if the PC & the relative software are powered down.

I mean. I have checked out on few dedicated web sites and all reported to me the same wiring scheme I have implemented. I have checked the connection with a tester and nothing is wrong.

Any suggestion ? Have I used the wrong scheme ?

I strongly hope somebody will give me some support..

Alberto

Double check your wiring against the diagram, you might possibly
have put your PTT to ground.

Some Radio to TNC wiring includes the use of capacitors if the
PTT is also wired to the transmit audio (usually the case when
using HT's)

I believe this is the picture that you are referring to the wiring:
http://www.packetradio.com/!TNCables/060KV.gif

Which shows the setup you described you used.

Good luck!
-Ian

I think your connections for the KPC-3 are wrong - check the manual.

Several weeks ago I read this message and thought, yeah I did all that! Now I reread the 6.1.5 section of the AX25-HOWTO and noticed a small note way at the bottom of the page stating that you have to not have the Linux sound drivers loaded when you try to use the packet modem! HMM! I am not sure if I "modularized" the sound drivers, and made sure they are not loaded. I am not sure if this will fix my problem, but if so I am going to write a small notation that I will ask to have added to the AX25-HOWTO in BOLD PRINT!

I do know that when I did an "ifconfig -a" the sm0 and such all showed up, but I could not "ifconfig sm0 up" it. I know that if it had "uped" properly, I would see it when I did a plain olde "ifconfig (enter)" and that never happened.

Thanks for the pointer, I will try it again in several minutes to see if this resolves the issue, and I see the sm0 device come up after doing an ifconfig sm0 up on it!

Don't bother. Word is there will be limited bus transport between parking
lots so unless your
ready for a looooooooooooooooong walk
to get to the Arena, it will be a most discouraging
and visitor/patron un-friendly atmosphere as
it was when I went (and will never goto another
Hamvention, ever again, untill they move it to
another site. The Hara site is far-too undersized
and it's nothing short of a major pain-in-the-ass
to ge into, around and out of. It's NO fun at Dayton anymore)

I have three TNCs (2-PacComm Tiny-2s and 1- TNC-200) and the EIA matrix box
with cables for sale. The EPROMs are TheNet.
It's all been checked out and works well.

This is the heart of a three frequency digipeater. One TNC was used for
forwarding, and two for LANs (on 2 meters and 440 MHz). Just add 12 VDC,
three radios and go.

One IC-3-AT with DC module is also available (was used for the forwarding).

TNCs $50 each plus shipping. EIA matrix box $50. IC-3AT $75. Whole
package including shipping $225.

USPN http://www.uspacket.net is proud to announce a new addition to our Tutorials page, covering the excellent RadioMirror multicast packet radio software/protocol authored by John Hansen W2FS.

RadioMirror amateur packet radio multicast software is a powerful tool for distributing information to many hams at once, and can be especially useful during the course of an emergency. At 1200 baud, RadioMirror can move up to 20 MB of data per day! RadioMirror can send any type of computer file, and even entire disk directories along with any subdirectories and all their files, which will appear intact with the same structure on each and every recieving station's hard-drive.

RadioMirror can do this simultaneously for an unlimited number of recieving stations because it is an unconnected protocol, similar in this respect to APRS, and the AMSAT multicast protocol. A non-ham digital serice that operates in a similar fashion is EMWIN, the multicast transmission put out by the National Weather Service.

RadioMirror net-works like this: One transmitting (Server) station's multicast transmissions are received simultaneously by many receiving

(Client) stations. Any ham can send information updates to the RadioMirror server's operator, by using voice repeaters and/or packet. The server then distributes the information to all participants in the network, including an unlimited number of stations that do not contribute information to the multicasts, but only receive them. Contrary to practice in traditional point-to-point networking, these receive-only stations are counted as a vital participants in a multicast network.

The kind of information that can be distributed are only limited by our imagination and the FCC PART97 regulations. All kinds of public domain computer files can be distributed by RadioMirror, including graphics and executables. For most purposes though, Text files and HTML documents will probably be the most widely utilized because they carry a lot of information in a small package and can be rapidly updated.

Anyone with a receiver, a computer, and a KISS TNC can pick up the files distributed by RadioMirror, making it very easy and inexpensive for Hams to participate in this type of network!

The natural advantage of RF over wired systems is that you can distribute information to many recipients at one time. Our traditional point-to-point packet radio systems have not taken advantage of the real power of radio, the way RadioMirror's multicast protocol does. Because of this, RadioMirror is at once the most revolutionary and the most efficient digital mode that exists for wide-area, rapid distribution of digital information.

I know, I was only kiddin'.  I use my FT-100D for packet with the laptop,
but
I also use if for FM VHF/UHF also.  Only used for packet when I want to get
on the air with the keyboard, my APRS is on the FT-1500M as noted below.

Let me know when you get your packet cable for the VX-5R, I have a VX-1R
and am awaiting for the 4 conductor jack to complete my cable.

Also, you said you have a whip antenna on your HT, is that the replacement
for
the rubber duck antenna that it comes with?  Where did you get yours?

Hambone?,

I had the opportunity to visit Hamvention for a few years now, and anything
this large will have it's share of problems.
I left the hotel early, parked right across of Hara in one of the pay lots,
and did not have that far to walk.
When I did make a purchase, I flagged down one of the people driving around
in those Golf Carts,
and got a ride back to my vehicle.

This year, at the last minute, myself and some friends decided it would be
nice to have a Flea Market space.
We have a lot of items on our "Want List", and would welcome to opportunity
to sell some items we have to generate funds.
Last year, we noticed there were quite a few open spaces, and with the
economy the way it is this year maybe someone out there
wants to sell there space for what they have into it.
So.. I am still looking.. Hamvention has not answered any of my email
inquires yet and it has been over a week.

If anyone has an available space, and want to sell it, please send a note to
my address below.

k4kal at arrl dot net

Thanks,
Keith

I copied this from the "...boatanchor" forum:

I'm not going to be able to go to Dayton this year. I have a great
flea market space, admission ticket, and the VIP Outside Vendor
Parking Pass available.

Please call 843-871-7749 if interested.

Steve Thomason, W4IJ

I would like to set up an HF remote base as follows. A computer running rig control software issues CAT commands at 1200 baud from the RS232 output. This goes to a Bell 202 modem connected to the microphone input of a UHF transmitter at the control QTH. At the remote QTH, a UHF receiver has the speaker output connected to another Bell 202 modem which recovers the data. A 1200/4800 baud rate converter is then used to drive the CAT input of the HF radio (which only works at 4800 baud). The communication is one way: commands are send to the HF radio, but nothing is read back. In principle, this seems like it should work, but I need to get the modems into "bit mode" so that communication is one way without an extra stuff thrown in that would confuse the HF radio. Also, no handshake of modems is possible since there is no reverse UHF path. Where can I get simple modems that can operate in this simple mode (as opposed to V.23 or whatever)? Can I get away with some ultra simple circuit I can homebrew from Exar 2206/2211 chips? Also, what about baud rate converters?

I'm trying to setup MSYS v1.18 (get it to work before v1.19 install) and here's my problem.

It's up, I can connect locally, people can connect over the air. But, we can't send bulletins.

Here's the routine>

```
Enter command: A,B,C,D....X,Y,?,* >
SB ALL
Enter title if local, CITY STATE & POSTAL CODE if not local:
This is a test
Enter text, end with ^Z or /EX, ^A to abort

This is a test message

/ex
Old bulletin Msg 27 Killed
Enter command: A,B,C,D....X,Y,?,* >
```

We can send private messages, traffic, and replies, but no bulletins.

MaxBullAge is 21, and my MSYS.DO, MSYSHCL.DO, MSYS.OPT files are all pretty basic. I don't get it.

I used to run MSYS a long time ago and I don't remember this problem.

73,
Ian KE6CBL

Maybe v1.18 is not Y2K compliant, so it thinks it has bulletins from the early 1900's. Maybe it's wiping out 100 yr old bulletins as fast as you can write them.

Just a thot! But I'm no expert on MSYS... Maybe the upgrade will fix it, I'm thinking.

```

Yes, if performance isn't an issue, you can go bit banging with the Exar chips all day long. The problem is just as you suspect, the baud rate conversion. If you're going to use a bit oriented protocol, you'll need the baud rate conversion to be bit oriented too --meaning that something needs to buffer up a complete transmission frame before resending it at a higher rate. If you don't do this, then extraneous marks or spaces can be inserted.

By the way, there are much better ways of sending data than using a Bell 202 modem over a NBFM link. Why not kill two birds with one stone by using 4800 BPS modulation on a real FSK link?

That's a good idea, I did try the upgrade too and it didn't work.

I'll roll back the date to pre <2000 and see what that does.

Thanks for the suggestion!

Problem with me is, I've never operated MSYS so I don't know much about it. There is an MSYS SYSOP who participates in the BBS List at USPN though, who might be able to help you out. If you don't do any good here, you might look over there.

At the USPN web site, push the "Lists" button on the left, then choose the list that interests you there. The BBS list is a good place for SYSOPs, in general.

Hey do any of you guys operate NEWQPSK/Q15x25 mode?

One reference said the freq for that is 14.109.5 but I haven't seen anybody there. Supposed to use FEC, is a connected mode, and sends/recieves up to fifteen 88 baud PSK streams for a total of 2500 baud. Acts like packet, sounds like psk.

I tried it out on VHF the other day... By using a really long TXDELAY, a local ham and I were able to connect over the local voice repeater!

Anybody on HF with it? When and where?

Charles, N5PVL

Oh barf ... stupid links did not copy correctly.
Oh well ... Google finds a lot of good information.

RGR, I had been using "DogPile" but it only gave me info on a few Linux
drivers, and nothing really informative about Newqpsk / Q15x25 mode as far
as operating procedure goes. I hardly ever remember to try "Google", guess I
ought to more often.

I've noticed that all of the best soundcard packet drivers seem to come from the same guy, Thomas Sailer, HB9JNX/AE4WA.

You'd think a guy who could do all of that would be your typical pencil-necked geek, but no, not this one... I was at his web site a while back, and the women in the family here wanted to know who the handsome guy on the screen was. I think my XYL developed a crush over the dude.

My wife just now looked over my shoulder at this post and remarked that yes it's true... HB9JNX doesn't really look like your typical packet radio geek. I resisted the temptation to look in the mirror and remind myself what a typical packet radio geek looks like... "It ain't purdy", as we would say here in Texas!

Moving right along and veering back towards the topic, I was able to use Flex32 with Thomas Sailer's "soundmodem" driver to set up and operate a Packet/Newqpsk gateway yesterday for a few hours.

Newqpsk is the old name for Q15x25... The soundmoden driver has been around longer than the new Q15x25 dll package for MixW, which explains a lot of things besides the old name. The MixW version, for example, has more flavors of FEC available in its options, being a more recent release. Also, most of the default settings on the two packages are different. - You would have to play around with them, to get them to talk to each other.

Ther FlexNet group recently came out with a new version of Flex32 (the "Windows" version of FlexNet) that allows you to come in on one port, and digi out through another port of your choice by specifying an SSID. You can even come out on the same port, if you specify that port's SSID. Since I run a packet node, I didn't see much use for a simple digi like that and kind of ignored it.

Then a few weeks back while writing up a tutorial on soundcard packet with Flex32, I happened to notice the "Newqpsk" option among the soundmodem's built-in drivers, along with several flavors of FSK and AFSK packet at various baud rates. After I finished the tutorial on soundcard packet, I went back to check out Newqpsk.

After tinkering with Newqpsk for a while, I remembered the simple digi function in Flex32 that I hadn't been all that excited about, and a few minutes later I had a VHF Packet/ HF Newqpsk gateway running.

As an "acid test", I wrote up a connect script so the Packet BBS here could try to go out through the Flex32 digi and make a connect attempt on HF, in Newqpsk mode. It worked, except of course there was nobody there to connect to.

Admittedly, the Newqpsk driver in the Flex32 soundmodem driver is not the latest version of this evolving mode, but still it looks pretty useful due to its ability to gateway to Packet.

I've never heard of this being done before, but there's lots of things I've never heard about. Is anybody else playing with this "gateway" function?

Charles, N5PVL

What kind of tx/rx and rx/tx turn-around times do they have?
Do they modulate both the VCO and the PLL reference?

Dana K6JQ

I got to try out Newqpsk on 20 meters yesterday evening, by a pre-arrainged schedule with Mike, KC5MAI.

I'll start off by mentioning that Newqpsk is not a weak-signal mode like PSK. In that respect, it seems slightly better than 300 bd packet, but not by far. For good performance, you need a good clean bit of spectrum.

Band conditions were pretty bad last night, but there were other digital sigs out there, so it wasn't THAT bad.

Flex32 has no tuning indicator, and tuning Newqpsk with no indicator is just like HF Packet - A real challenge! We had agreed on a freq though, and were able to hear each other and diddle the tuning until the two stations achieved a connect.

It operates exactly like HF Packet. If something makes it to the other station at all, it makes it in 100% condition. No dropped characters or garbage characters. On the monitor screen, you see what looks like regular old AX25 packets. - Sure sounds different though!

Both stations ran Paxon as the terminal program for Flex32 with the soundmodem driver. My TS-450sat talked to Mike's TS-2000. My HF vertical talked to his inverted-V over a short-range, groundwave contact, so cross-polarization came into play, attenuating our signals.

Our link was not good, as the band was noisy, but still I managed to transfer a 5k text file, and we QSO'd for 30-45 minutes. Overall throughput for the contact was about what I would have expected out of HF Packet, except for a few occasions when the band momentarily cleared up. On those occasions, Newqpsk was transferring 256 character packets over fifteen 88.33 baud psk streams at an effective 2500 baud, and the throughput during those brief periods was impressive, giving me a glimpse of Newqpsk's potential.

As I noted in an earlier post, Newqpsk is a wide mode, too wide to be legal for unattended operation on HF. For "attended" operation though, it is as legal as church on Sunday.

I found out that the Flex32 "Newqpsk" and MixW "Q15x25" are identical. The big difference between the two is that MixW gives you a great waterfall display for tuning, and Flex32 lets you gateway Newqpsk to Packet, opening up all of those packet applications for use with this new wide mode.

Newqpsk works great on VHF too, by the way, faster than 1200 baud packet at no additional expense. If you are set up with the FlexNet soundmodem for 1200 baud packet, running Newqpsk is just a matter of setting up the software for that mode in the soundmodemconfig program. If you prefer MixW, you just have to download and install the Q15x25 dll package from the MixW web site.

Charles, N5PVL

In the couple of weeks that I've been playing with PSK31
on HF, I've found activity on 20 and when they're open, on
15 and 10 meters.

So far I haven't heard any PSK31 on 30 meters or on 17m.
Are any of you doing PSK there? Are there standard PSK
frequencies (like 14.07015 / 21070.15) I haven't found?
TIA!

The Windows 95 "Terminal" program works just fine with the KAM and gives you
a bunch of programmable buttons for, "goto xmit", "immediate RX", "CQ", etc.
The newer "Hyperterminal" works OK too, but is harder to set up. It handles
COM5 through COM7 too.
I run the KAM in terminal mode from within my logging program, DX4WIN, which
has a simple communications program built-in.
I use the KAM to transmit in FSK mode, and I use MMTTY for receive! It does
a slightly better job most of the time, and has a better tuning indicator.

John, K2CIB

USPN   http://www.uspacket.net is proud to announce a new Tutorial on
RadioMirror, the excellent multicast packet software and protocol authored
by John Hansen, W2FS.

You are taken step-by-step through the entire process, with screen-shots of the software setup.

RadioMirror amateur packet radio multicast software is a powerful tool for distributing information to many hams at once, and can be especially useful during the course of an emergency. At 1200 baud, RadioMirror can move up to 20 MB of data per day, and can operate at higher baud rates for more throughput! It is much easier and cheaper to receive high-speed packet than it is to transmit it. RadioMirror can send any type of computer file, and even entire disk directories along with any subdirectories and all their files, which will appear intact with the same structure on each and every recieving station's hard-drive.

Partially recieved files are saved, and the gaps are automatically filled in by the software when it receives later multicasts. The server sends its data over and over in a constant cycle, automatically updating the client stations' receive directories as the server's transmitted files are updated or changed.

RadioMirror can do this simultaneously for an unlimited number of recieving stations because it is an unconnected protocol, similar in this respect to APRS, and the AMSAT multicast protocol. A non-ham digital serice that operates in a similar fashion is EMWIN, the multicast transmission put out by the National Weather Service.

An article outlining one way to utilize RadioMirror for emergency digital communications can be found at http://www.uspacket.net/l_ecom01.htm

A RadioMirror net-works like this: One transmitting (Server) station's multicast transmissions are received simultaneously by many receiving (Client) stations. Any number of sources can send information updates to the RadioMirror server's operator, by using voice repeaters and/or packet. The server then distributes the information to all participants in the network, including an unlimited number of stations that do not contribute information to the multicasts, but only receive them. Contrary to practice in traditional point-to-point networking, these receive-only stations are counted as a vital participants in a multicast network.

In a traditional point-to-point type packet network, the appearance of more than two stations on the frequency at once will rapidly bring on an overall loss of efficiency, because each station must transmit and so competition for air-time arises, along with collisions, etc.... After a certain number of stations attempt to participate on one freq at the same time, point-to-point packet becomes pointless!

By way of contrast, with a multicast network there is only one transmitting (server) station transferring data to an unlimited number of receiving (client) stations. There is no competition for air-time, since the Multicast Server transmits 1kb packets with almost no "down time" between packets. The data stream is almost continuous. Because of this, the more (client, receive-only) participants there are on the freq at one time, the more efficient the multicast network becomes. - The more the merrier!

The kind of information that can be distributed are only limited by our imagination and the FCC PART97 regulations. All kinds of public domain computer files can be distributed by RadioMirror, including graphics and executables. For most purposes though, Text files and HTML documents will probably be the most widely utilized because they carry a lot of information in a small package and can be rapidly updated.

Anyone with a receiver, a computer, and a KISS TNC can pick up the files distributed by RadioMirror, making it very easy and inexpensive for Hams to participate in this type of network!

RadioMirror Tutorials:

Tutorials for RadioMirror Server and Client stations, can be found at USPN, on the "Tutorial" page.

The natural advantage of RF over wired systems is that you can distribute information to an unlimited number of recipients at one time. Our traditional point-to-point packet radio systems have not taken advantage of this unique and powerful capability, the way RadioMirror's multicast protocol does. Because of this, RadioMirror is at once the most revolutionary and the most efficient digital mode that exists for wide-area, rapid distribution of digital information.

RadioMirrors multicast protocol can never replace traditional point-to-point networking, because there are many things that only point-to-point networking can do. - But what RadioMirror networks *can* do greatly enhance any packet net's capability, and reduce the load of point-to-point networks, increasing their efficiency.

If you would like to build an advanced ham radio information system for your area, RadioMirror is a good system to use in addition to traditional voice and packet, taking the power of Amateur Radio to a new level.

Hi,

Does anyone have a pdf datasheet for the NxtWave 2000 VSB demodulator they could send me.

Thanks
Bob

If anyone wanting to unload a Hoka Code 3 Gold (full version), please drop me a line. C3GPro is an alternative, or Code 30 if at a low price :)

I've been using RadioRaft 3.21 and would like to try the Hoka, but the wallet isn't deep enough to buy it new. Anyone out there worn out from listening to all those dits and dahs?

Located in Northern VA, USA.

Thanks all,

Ed P.

I find them to be somewhat unreliable, my friends call the BayCrap Modems.

Suggest you try a standlaone TNC or Soundcard modem.

Hi,

I'm trying to make operational my old Packet Radio
setup on a PC. Was running TCPIP/AX25 on 439.025 MHZ but do not hear
any Packet on this frequency. Not sure if my radio is deaf or what.

On what 440, 2M, and HF frequencies are packet active in Los Angeles
and San Fernando Valley?

There was a voice Packet Radio Net on 2M where
Packet issues were discussed? Does this still exist?
What time and frequency?

Many thanks, 73, W6MIK, Dave

There are only two frequencies which are TCP/IP specific in Los Angeles:
     144.930MHz and 223.660MHz
(I have such ports on my box in the LA basin - with the 2m port currently down for repairs - but I haven't heard anything on the 125cm port for quite a while. I cannot hear the San Fernando Valley stations in general.)

There are some frequencies which are shared with other modes for which TCP/IP is apparently used (or at least some TCP/IP hosts have used):
     439.025MHz (9600 baud) and 441.500MHz (AX.25 mail interchange)

Los Angeles recently went through a housecleaning cycle. Your old ampr.org IP address was probably expired due to inactivity and in favor of a new geographic and frequency based assignment that went into effect this year. This was also in part necessary because there were IP address assignments made back when the area was allocated 44.16/16, but about 3 years ago, the allowed assignment range was tightened to 44.16.0/18 and the stations outside of the reduced range failed to move.

The Packet Radio net on 145.300- (LA County Sheriff's repeater) on Mondays at 8pm ended officially in October 2000 due to a lack of activity.

The local bandplans listed at http://www.qsl.net/scdcc are still in effect. Note however that the TCP/IP numbering plan for the Los Angeles area that was proposed is NOT the one that went into effect. There are no local plans for packet use of HF - the national plan is followed below 30 MHz.

Most of the digital activity has left the air or has been converted to APRS (on 144.390MHz). There are a few die-hards out there still.

Hi,

Many thanks for the very informative update on Packet
and changes in Los Angeles PAcket activity.

Much to absorb in your mailnote. Had no idea my IP address might expire.

I will see what APRS offers on 144.39.

73, W6MIK, Dave

I am interested in trying APRS Tracking.
If you have a Alinco DR135T/TP or /TPG you would be interested in selling
please email me at K4KAL at ARRL dot NET with price.

Thanks,

Keith, K4KAL

They were expired because there were about 600 of them issued yet less than 10 of them could be identified as actually in use (in addition to the other reasons previously mentioned).

The problem I have with ampr.org is Internet related. I operate a number of

E-mail reflectors and have learned to distrust ampr.org addresses.

When I get a lot of bounced messages, more often than not the culprit will be an ampr.org address that has flaked out. They are amazingly unreliable; the worst of the worst, even out-doing "Hotmail" as a source of bounced messages on the E-mail reflectors that I have administered over the years.

In this day and age, when competent Internet access is so cheap asnd easy to obtain, there is no excuse for having to settle for an ampr.org address for online activities.

If the ten (or less) hams in L.A. who still bother with ampr.org want to use that stuff on the air that's just fine, but I sure wish they would keep it off of the Internet!

A few years back, the problem was so bad that I considered just banning all ampr.org addresses from the lists I administered at that time. I am glad now that I did not, as I have noticed since then that the ampr.org addresses are becoming increasingly rare.

The problem appears to be taking care of itself.

Charles, N5PVL

That wasn't an ampr.org problem. That was a problem of having too many host administrators not knowing how to properly set up their hosts to either have 24/7 connectivity and/or a mail relay (cf. MX-RR in DNS) to handle their mail when their hosts are not connected to the Internet at large, either directly or indirectly. These issues could exist in any domain. Granted, they were more prevalent in ampr.org because of its anarchistic lack of rules (e.g. "connectivity is the problem of each host administrator to solve on his own"). The real problem was that any attempt to impose a network order was always fought by someone - yet a network cannot function without some order to it.

> In this day and age, when competent Internet access is so cheap asnd easy to

Since when has an ampr.org IP address ever been "a last resort?"

> If the ten (or less) hams in L.A. who still bother with ampr.org want to use

See the above. If properly administered, there would be no such problem, so there's no need for your wish.

That's because the only ones remaining are those die-hards who actually KNOW about networking and do things correctly. All the idiots have been kicked out in this area, and are being kicked out in other areas.

... which is an ampr.org problem.

I didn't really comment on the "why" of it all, I was just pointing out the
end result.

These folks made a career out of making Hams look dorky and flakey to people
who provide services on the Internet. I for one am glad to see that most of
them are gone, perhaps to move on to something that will reflect better on
the hobby.

AMSAT limited their AMSAT BBS's to a manageable number, each station
intended to cover a large geographical area. I was going to cough up the
bucks to set up as an AMSAT BBS once, and was told I was too close to an
AMSAT BBS in west Texas, 450 miles away.

If they had something like that with Internet/Packet gateways, things would
have worked out quite differently. They would have been fewer, but also
better.

The purpose of the gateways was to tunnel through the Internet. To connect distant RF LAN's together. There used to be a BBS in every large town, and I don't remember too many feeds coming from AMSAT. The thing that made BBS's boring, was there was no content. You can only live so long by posting classified ads, out of band mods, and bitches about your fellow Hams. Just kind of dried up, and we are all better for it.

The gateways went away after the RF LAN's went away. I'm sure there are a few die-hards left, but Morse code and PSK31 is probably 1000 times more popular, because you are having a real conversation, and that's what Ham radio is about--communicating. Radio Relay sucks.

Actually, we already had HF for that. Gateways were there to undermine first the use of HF, then VHF/UHF for networking amateur packet radio. The idea was to undermine and destroy the extensive digital ham radio network that existed, and replace it with tcpip LANS. I first heard this plan put forward by Greg Jones WD5IVD when he was president of TPRS, prior to his association with TAPR. His tcpip buddies at that time were very excited by Greg's plan, and parroted his comments back and forth among each other for years as they implemented that plan.

The destructive part of the plan worked very well. The constructive part never developed though... The US amateur tcpip community was always much better at tearing down the work of others than they ever were at building anything, themselves.

Amateur tcpip in a nutshell: Great for undermining Hams trying to use Radio.

> There used to be a BBS in every large town,
> and I don't remember too many feeds coming from AMSAT.

Precisely - for the reason I mentioned above. There was a limit on the number of AMSAT BBS's. Each one had to cover a pretty good-sized area. The AMSAT BBS were there to work WITH the existing HF network, not attempt to replace it or undermine it. This is because the AMSAT people are real Hams, who know how to play well with others.

You can't really say that about the amateur tcpip community though, who invented the "protocol wars" that caused so much divisiveness within the ham radio community, and who have put much more effort into destroying and denigrating the work of others than they ever put into building anything, themselves.

Look at yourself, running down what other hams have done. - Your knee-jerk negativity is typical of the amateur tcpip community, and you guys JUST CAN'T FIGURE OUT why your group never achieved any popularity within the ham radio community.

Duh!

> The thing that
> made BBS's boring, was there was no content. You can only live so long by
> posting classified ads, out of band mods, and bitches about your fellow
> Hams. Just kind of dried up, and we are all better for it.

Actually, BBS's did not go away due to content issues; They went away because they were undermined in their ability to pass traffic. Internet gateways were used to disrupt message forwarding networks around the world, and this cynical "assistance" from gateway operators soon accomplished its purpose. This was a central part of the plan I heard Greg Jones put forward. The HF nets were considered to be essential to the world digital ham network that existed at that time, and they were no good for tcpip, so they were to the very first part of the existing global network to be attacked.

Let me guess... You don't have a clue as to how "Internet Forwarders" could possibly have had a negative effect upon the BBS forwarding network - do you? Your story is that they were there to "help out", right?

> The gateways went away after the RF LAN's went away.

Mission accomplished.

>I'm sure there
> are a few die-hards left, but Morse code and PSK31 is probably 1000
> times more popular, because you are having a real conversation, and that's
> what Ham radio is about--communicating. Radio Relay sucks.

So you are coming out of the closet as being down on the entire concept of networking Amateur Radio....

I'm shocked! - Who would have ever guessed?

Fortunately, the US amateur tcpip community lost cohesion and fell apart before they had quite managed to destroy everything. The HF nets are still set back by your group's activities, but most of the VHF/UHF nets not only hung in there despite the best efforts of TAPR, they are now actively growing again.

If you look at actively growing, successful VHF/UHF networks in the US today, one universal feature among them is that they totally ignore TAPR, and incorporate absolutely no gateways into their network. The ones that allowed gateways, such as TexNet did, have all gone away.

Two large-scale VHF/UHF networks presently cover the entire East coast of the US, from Canada all the way to Florida. These networks penetrate inland from 100 to 350 miles, all up and down the eastern seaboard. Another group of VHF/UHF nets cover the great lakes area, another group is growing out of Arkansas, where they have built a statewide packet network from scratch after TexNet evaporated. There are two other groups out west. These are the large-scale VHF/UHF networks. There are, of course, hundreds or possibly thousands of smaller packet nets scattered around as well. I regularly get e-mail from hams starting up new packet nets, dusting off their TNC's so they can have fun with packet radio.

TexNet once had over 100 nodes, all 1.2 kb access with 9.6kb backbone. - Then they started using gateways to link the nodes instead of 9.6kb RF, and guess what? Within three years the entire TexNet network had ceased to exist.

In fact, TexNet is the only large-scale VHF/UHF net that switched over entirely to using gateways instead of RF for their "backbone" - and TexNet is the only large-scale packet network in the US that has completely disappeared without a trace.

The rest of them not only still exist; They are actively growing again. One network in the northeastern US has put up over 100 nodes in the last five years.

Also: The HF nets are coming back. There is now several core groups of HF digital Hams who ignore gateway operators and will not allow them to "help out", by routing traffic around Hams who use radio. These groups are now starting to consolidate and organize, brightening up the future considerably for digital amateur radio around the world, not just in the United States.

From your attitude, it is plain that you wouldn't want to have anything to do with rebuilding the US digital ham radio network, so the following is really for other readers here:

To see what hams are doing with Packet in the US today, and to how you can be a part of that, drop by for a visit at USPN : http://www.uspacket.net

USPN Mission Statement

The terrorist attacks of September 11th, 2001 and subsequent events have highlighted the need for more advanced, more comprehensive amateur radio emergency communications. Hams have enjoyed increased cooperation and respect from many government agencies and officials in the wake of 9-11, including a special message of praise and encouragement to U.S. amateurs from president George W. Bush.

At the same time, significant advances have been made in the equipment and software availble to digital amateur radio networkers, making it possible to build network we could only dream about in years past. Amateurs not only have a clear mandate to develop our capability to provide communications in times of emergency or disaster, but we also have the means to do so in a meaningful fashion.

Packet radio (in conjunction with other digital modes) has enormous potential to provide fast, accurate emergency/disaster communications. With the recent resurge of interest, several of our large-scale VHF/UHF networks have begun to expand and upgrade, and new packet networks are again springing up around the nation.

By building and developing independent, amateur radio network that does not depend upon standard, non-ham methods of communicating such as the Internet, amateurs arrainge to be there when they are needed the very most - when traditional methods of communication have broken down or become overloaded during the course of an emergency. Our mandate is to provide independent, alternate emergency communications and only networked amateur radio is relevant to that purpose.

Soon, we can reasonably expect to begin tying our regional networks together into a cohesive, national digital communications network, completely seperate and independent, through the participation of thousands of American hams. It is a large, ongoing task, not something we can expect to "finish", as our networks must not only grow, they must also be maintained and upgraded as we go along.

Now is the time for amateur packet radio networkers to share information, get to know each other and work together more closely than we ever have before. We will be addressing a challenge, answering to a mandate and having a good deal of fun while we are at it. It is this spirit within the hobby that USPN is here to facilitate. We dedicate our efforts to the many amateurs who participate in this fine aspect of amateur radio, and to the people of the United States of America.

Ahem!   I hate to be the one to point this out, but there are two camps involved in packet radio today:

Camp 1: Talks about doing something with IP, at high-speed.

Camp 2: Actually does something with AX25, at low to medium speed.

When I say "actually does something" in this context, I'm not talking about individual efforts, or small experimental networks, but instead I mean large-scale, organized networks that make a difference in the real world. All of the existing ones are AX25 networks.

To see these, go to: http://www.uspacket.net and push the "Network" button. We have several packet networks in the U.S. that are in the "awesome" category.

No "IP Only" packet network has even remotely approached the level of usefulness I'm talking about.

That's a shame, because the benefits in using IP are obvious.

Still - The fact remains. Hams just do not appear to get excited about IP in large numbers, and large numbers of participants is much more important than winning or losing another battle in the protocol wars.

The idea is to get something done.

To cut through the obfuscation and nonsense involved in "protocol wars", the attitude at USPN is that success talks and vapor systems walk. We look around at what actually flies in the real ham radio world, and what doesn't.

What comes up here in the U.S. are AX25 systems, featuring 1.2kb access with 9.6 and some 19.2kb backbone links. On HF, the PACKET, CLOVER and PACTOR II systems do more (from a networking standpoint) than the rest combined. The sucessful networks all pretty much look this way. Take a look for yourself!

As far as experimental systems go, I've run across the same problem with the multicast software I lean toward. It's use would be a real advance, it does a lot more, etc. and so on, but the fact is that not very many hams are excited about using it. No "critical mass".

I have heard numerous "critical mass" predictions related to amateur tcpip over the years. When a hacked-up version of normal BBS code was patched onto

"NOS", critical mass was supposed to be just around the corner. That flopped, so next it was the ability to use regular tcpip apps included with operating systems that was supposed to bring on "critical mass".. That flopped too. Now it's the wireless networking equipment. That will flop too, so sorry. "Critical Mass" is not just around the corner.

The reason for it has nothing to do with mythical "killer apps", improved networking protocol, or inexpensive wireless networking equipment. Fact is, not many hams warm up to the IP stuff. They just don't go for it in significant numbers. For whatever reason, that's how it goes.

So... When anybody asks me what is being used for digital amateur radio networking, what really works and can be done at a reasonable cost, I recommend AX25 packet with 1.2kb access, 9.6kb (or better) backbone. On HF, PACKET, CLOVER or PACTOR II do the most work, PACTOR III is the best of the best if you can afford it.

I am looking forward to being able to point out a significant achievement from an amateur radio IP group, just as I would like to point out significant use of multicast protocol. - But I can't do that right now, and right now is when things need to be done.

It's nice to be able to kick back and put in years of debate over fine points of the "protocol wars", but at USPN, we honor those who accomplish things over those who talk about doing them. Networkers who design, build, and maintain functional networks are our "experts"... The ones who walk the walk. When it comes time to get things done (Now, for example) we look to these great Hams to see what tools and methods are most likely to produce good results.

Who really gives a sh-t about TAPR anyway? All it ever was was a LOCAL group with delusions of grandeur. No one in my area ever gave anything they did any significant weight (like was apparently given from other regions of the country).

> The destructive part of the plan worked very well. The constructive part

> better at tearing down the work of others than they ever were at building
> anything, themselves.

Are you certain? In this area, the TCP/IP gateways (as gateways to replace HF) are gone and the AX.25 mail HF gateways (the few that exist) are the ones that survived. Just because it happened the other way in your region doesn't make it globally true.

That's also because they (the majority of TCP/IP'ers) were idiots who didn't even understand the networking structure they were professing. A conversation I had about 3 years ago with another amateur went like this: "OK, I have an IP address. What do I do with it?" Although an extra class licensee, he was almost as computer illiterate as they come on top of it all. He's a nice person otherwise, and quite an avid HF (both code and voice) user, but clueless as to any packet operation, let alone TCP/IP.

Being a "real ham" isn't significant. Having an understanding of computer networks is.

> You can't really say that about the amateur tcpip community though, who

Even the LANDLINE BBS (not amateur radio) community realized in the mid 1990's that the Internet was taking over from the role that they had played for 15 years - and that it was time to adapt (by becomming Internet hosts aka

mini-ISP's) or die. The only really significant place where LL BBS's are still
prevalent is in Alaska, where Internet connectivity isn't better (on the
whole), and the use of the LL BBS's allows for "local issues" to remain local.

HF gateways are still essential for DISASTER COMMUNICATIONS - where the
Internet is unavailable because the communications infrastructure is damaged or
destroyed. Unfortunately, those who abandoned their HF gateways in favor of a
high(er) speed wired network lacked sufficient foresight. This is one of the
major reasons why the Los Angeles area still has at least one HF gateway at the
moment.

Are you certain? The mission was replacement, but in many areas, BOTH the HF
gateways and Internet forwarding disappeared. That's really a failure, not an
accomplishment.

...And although the Internet didn't have as much popularity in Europe, over there, they seem to have a "happy balance" of methods.

> If you look at actively growing, successful VHF/UHF networks in the US
> today, one universal feature among them is that they totally ignore TAPR,

...Or had rules or restrictions regarding wireline forwarding to the point to prevent REPLACEMENT of the HF gateways by the Internet. I agree with the fact that they ignored TAPR. Southern California has always ignored TAPR, and we're next door to them.

> Two large-scale VHF/UHF networks presently cover the entire East coast of

> exist.

Their choice to REPLACE instead of ADD/augment their backbone with wireline is what really did them in. Also, technology is another problem: 1200 baud half duplex, in a world where the minimum wireline speed is in the 56kbaud full duplex range, just doesn't cut it. I'm hoping that amateur use of 802.11 equipment will bring back the wireless stuff to popularity. I've even got an 802.11b+ (22Mbps) port on my packet machine now (and am waiting for another licensed friend to get his end running) - but currently that part of the wireless lan hobby is concerned more with "wardriving."

September 11, 2001 should have helped with that, let alone the May 2003
"tornado alley" attack in the mid-west (to the extent that the amateur
infrastructure was still standing).

In general, I have learned from your prior posts that anything you endorse is
either self-serving or doomed to failure because of your connection to it.

You are correct. Part 15 is the place to build LAN's, and not Part 97.

Morse code, and PSK31 type modes, are much more fun, and you meet

a better class of people. Hams that network below 11 Mbps are just
pissing their lives away.

I used to think highly of TAPR. They lost their sense of mission a long time ago, though, and now actively discourage hams from building digital network. They really only support "IP only" and APRS these days, setups that require Internet connections and cannot fully function as stand-alone amateur radio applications. If it is done with "just radio", then TAPR will pay lip-service while being careful to avoid actually being useful. If it involves networking digital ham radio, they will do whatever they can to actively discourage it.

For years I argued with TAPR, trying to get them to address the wishes of most hams in the U.S. instead of constantly trying to thwart them. Finally I decided to quit all of that carping and complaining though, and put my energy into something more constructive. TAPR showed themselves to be unlikely to reform, so I quit worrying about them.

In past months, TAPR has turned out to be quite useful. Ill-mannered, negative types like Jim Hale show up from time to time at USPN, and it is good to be able to send them off to TAPR, where their negative, anti-ham, do-nothing attitudes will be more likely to be appreciated, and they can enjoy the fellowship of thier own kind.

TAPR has been of help in some other ways there is no need to go into here. I do not see USPN as being in competition with TAPR, because the two organizations do completely different things.

Yes, I am certain. The global HF forwarding network was thoroughly undermined. There are a few good HF nets still in operation, but so far, they have not recovered as quickly or as thoroughly as the VHF/UHF networks.

In my area, the gateways hung in there long enough to be sure the HF nets were kapoot, then they shut down as well, mission accomplished.

At USPN, we are happy to answer any questions we can. Failing that, we try
to point people in a direction where the answer might be found. Nobody
starts off knowing any of this stuff, much less all of it.

As for TCPIP, it was grossly over-promoted, a consequence of the protocol
wars. I think the over-promotion set back amateur tcpip, and created a lot
of confusion.

I think be a "real ham" is always significant, if you are talking about an
amateur radio activity. Our sense of community is the most valuable thing we
have.

local.

>

Yes, I know about that. I ran a "Wildcat" BBS back in those days, if you are familiar with the old software. There are still a good number of those old-style LLBBS's around, but as you say, they are local-only propositions, usually dedicated to a specialized purpose.

I lost interest in the LLBBS and shut down about a year before Internet access became available. Since then, I have never been tempted to operate a mini-isp, preferring instead to lease space on other people's servers. It's cheap, it's easy, and there are less headaches. The web hosts I use are operated professionally. Those guys deal with problems I wouldn't know how to get started on.

Where I am, we have zippo, nada on HF at this time. I've been saving up for a good HF modem. The more you pay, the more throughput you can expect. Meanwhile, I've been kicking X15x25 around, trying it out a little.

I'm certain. How many amateur tcpip folks do you know of who are deeply concerned about packet BBS messages? Personally, I don't know of any. - The "internet forwarders" existed in order to undercut the entire concept of packet radio messaging. Once the HF operators were undermined and shut down, the gateways no longer had any purpose and shut down as well, mission accomplished.

> there, they seem to have a "happy balance" of methods.

The Internet was and is extremely popular in Europe. A big difference there
was that they went over to cable access while we were still slogging along
with dialup. Hardly anybody ever used dialup in Europe, because regulations
there made it prohibitively expensive. - So while some Hams over here were
trying to finagle back-door freebee access during the dialup era, the
European Hams were already past all that. The "amateur ISP" idea never
really caught on over there, for that reason.

Also we should not forget that regulations throughout most of Europe simply
do not allow the introduction of non-ham links into the ham radio network.
You can gateway overseas to where similar regulations do not exist, but
within Europe, it is not always so easy to arrainge. This put the focus on
what can be done with radio, where it should be.

Unfortunately, TAPR is perceived by many hams as being a national packet
radio organization, when actually it is nothing of the kind. TAPR is a
research organization with the words "Packet Radio" in their name, a
hold-over from earlier times. More than 90% of their total effort today goes
into various self-promotion efforts. Behind the great front they put up,
there is - nothing.

> >

They started off with Add/augment, but it rapidly degenerated from there. Greg Jones WD5IVD was in charge.

>Also, technology is another problem: 1200 baud half
> duplex, in a world where the minimum wireline speed is in the 56kbaud full

Actually, the evidence does not support that theory. Remember that at USPN, we look at what is actually being done, as opposed to theory about what might be done. Check out the SEDAN web site. That network has saved many lives and millions of dollars worth of property over the years, by passing simple text messages over a 1.2kb access/9.6kb backbone system.

Most emergency communications end up being of this nature. The slow/medium speed stuff is cheap, easy to set up and operate, and easy to maintain and repair. SEDAN predates the "protocol wars" and operated continuously while other networks experienced a serious slump. Today, many of the new VHF/UHF emergency digital networks are modeled after SEDAN, and with good reason. Their system undeniably works, and works well.

I'll comment about 802.11 in a seperate post. This one is too long already.

I would be most happy if we never needed emergency communications again, but the fact is that we always will.

```

There has been an ongoing dialog in the amateur radio community about 802.11
wireless modems for several years now; In fact the dialog began some time
before the equipment had generally become available.

One almost universally accepted idea for application of 802.11 equipment by Hams is to use it to extend basic Internet access into areas that have lost it. The most workable version of this idea is to have 20-50 miles of "portable" network that can be rapidly deployed where needed, when needed. After the emergency is over, the system is taken down, refurbished, and stored in readiness for future need.

A great idea, if anyone actually does it, and it works.

Because 802.11 is being pushed as a PR item in the ham magazines, dozens of new and potential hams are starry-eyed with unreasonable expectations for a low powered microwave system that is in widespread use by millions of non-hams, all across the country.

In metropolitan areas, for example, the steadily increasing layers of commercial 802.11 users are going to make it very difficult to get any appreciable range from these systems, even with dish antennas. There are ways to make it work of course if money is no object, but money almost always IS an object... Hams are generally thrifty.

At USPN, we are gathering information about digital amateur radio networks in the US. So far, we haven't heard of any appreciable network being built with 802.11... There are several experimental setups done on a small scale, probably hundreds of them. - But no organized, wide-scale network.

Years of hype - No network.

The organized, working networking is almost all being done at lower frequencies, and at lower data rates because this is what works best. Why they work best is seldom aparrent to a new Ham who has not had an opportunity to get a firm grasp of the laws of physics as they apply to ham radio, doesn't know much about the hobby yet, and who has instead been reading the PR material about 802.11 that is published in the Ham magazines.

That is the danger when you try to "PR" what is supposed to be rational and scientific... The natural tendency in "PR" is to accentuate the positive, and eliminate or ignore the negative, which obviously is a far cry from the basic requirements of either objectivity or reason. This creates a fog of misinformation and unreasonable expectations, most particularly affecting impressionable new Hams.

Not long ago, prospective Hams were being promised free Internet access by the "PR" types, never got it because it had always been illegal from the get-go, and as a result we ended up with a large pool of dissatisfied new Hams, brought into the hobby on the strength of a false PR claim.

Being bad PR, it highlights systems that nothing appreciable has been accomplished with, ignoring the excellent, large-scale US packet networks that actually exist and operate every day. The people who have actually accomplished something with packet radio are systematically ignored. These systems are downplayed so new Hams can be "sold" into the hobby on the strength of something that has yet to see any significant use. - A sure prescription of disappointment and disallusionment. - Again.

Unfortunately, most new and prospective Hams are thorougly exposed to this "tabloid" side of the hobby and so are starved for facts. The rational, scientific aspect of the hobby, and our most outstanding accomplishents are seldom presented to them.

Too boring! - the PR guys say. Don't scare new Hams away by talking about what Hams actually tend to do with radio!

The 802.11 stuff is kind of neat, but is severley limited by both federal law, and the laws of physics. There are obvious uses for 802.11, but using it as a basis for a "PR" campaign for the hobby is a good way to shoot off our own foot, disallusioning a large group of new Hams. - Yet again!

An anonymous Troll, ashamed to back up his words with his name. That's because he knows he is wrong.

Sounds like one of TAPR's supporters, still fighting the "protocol wars", and still in that exclusive little closet where he can pretend that everything else beyond his pet protocol somehow doesn't exist.

Obnoxious as they are, I've always felt a certain amount of pity for such individuals. To be so filled with ugly negativity as to live a life of denial... That's really sort of pathetic.

I suppose that if I was that screwed-up, I would be ashamed to put my name to my words too.

Charles, N5PVL

Hello, All!

I just have uploaded SeaTTY 1.16 beta to the main site and mirror:

                                 http://www.dxsoft.com/seattyb.zip
                                 http://www.hamport.com/seattyb.zip

V1.16
 Saved images preview was made.
 AFC works in FAX mode now (during "LPT speed detected" state).
 Squelch prevents auto-start at noise in FAX mode now.
 User can select LPM and IOC for manual start now.
V1.15
 SeaTTY can receive HF-FAX now.

Well, you are certainly wrong there! APRS is by no means a "dead horse", in fact it is very popular. How you can characterize it as "the only light in the tunnel" and a "dead horse" at the same time is beyond me.

USPN does not support APRS (other than referring people to TAPR) for two reasons:

1. APRS does not really fall within USPN's area of interest. - Amateur Packet Radio Networking.

2. TAPR already does a good job of providing support for APRS, and setting up seperate support at USPN would only create confusion.

Why re-invent the wheel?

I can't get the D700 and computer program (Kenwood's MCP for the D700) to communicate.

All looks good on a Win 95, but it hangs. Here's what I've tried:

I checked baud rates & power cycled the radio as required.
Checked the cable
Put an RS232 monitor in the line (Red/Green LEDs on DTR, DSR, RTS, CTS, TxD, RxD)
On radio power up it asserts the CTS line true and keeps it true.
The Radio's Tx line is set to idle (space). There does appear to be a short blip of
data (blip of mark seen as a short change from red to green)
The DSR line appears to be open circuit (NO LED ever)
When the MCP program is running but idle, it sets the DTR line true and
the Tx data to idle.

When the MCP program is commanded to "read" the radio:

It asserts the RTS line true.
The reading radio dialog appears, shows NO progress and hangs until:
The radio is shut off then about 4 seconds later a "communication
time out dialog box appears and it can be dismissed and MCP
control returns to me.

I tried to putting it into read mode THEN turning on the radio to see if
that data burst was the go-ahead, but it still hangs.

Radio works fine otherwise - doing APRS ok etc....

In article <balq0c$tqs$1@localhost.localdomain>, Nosko S.
<sorry.nospam@here.com> writes
>I can't get the D700 and computer program (Kenwood's MCP for the D700) to
>communicate.
>
>All looks good on a Win 95, but it hangs. Here's what I've tried:
[snip low level diagnostics]

Connect the D700 to HyperTerminal or some other terminal program, set to
9600,N,8,1, and, if the option is available, configure the terminal
program to translate CR to CR/LF and for local echo.

Switch the D700 into TNC APRS mode, and check that it doesn't get stuck
at "Opening TNC".

Manually send the command AI 1 followed by a return, the D700 should
respond with AI 1 and you should see data appear in the terminal
program every time the D700 sees an APRS packet. If you get the AI 1
response, and you see data, then almost certainly the problem is with
the Kenwood software.

Clearly, that's one difference. No one here EVER thought highly of TAPR.

Why should anyone care? They were 2 states away from your area. They had no
influence to begin with, and to attribute any to them only demonstrates the
delusion.

> In past months, TAPR has turned out to be quite useful. Ill-mannered,

IF their sole mission was destruction of ALL communication, fine. However,
their professed mission was replacement. If this [latter] mission was untrue,
then their duping of the amateur radio public should have been challenged - and
if not, that proves either: 1) How anarchistic the networks were to begin
with (which contradicts the premise of cooperation needed for a network to
succeed), or 2) How stupid the operators in that area were. Granted that
there's no intelligence test for amateur licenses, but one still has to wonder.

Overpromoted - Yes. However, was it the right idea? I say yes - if properly
done. It wasn't properly done. The key was to have interoperability, which
for the most part, didn't emerge in the U.S.

You missed the point. The point was that the network needed people who knew
about networking, not just amateur radio. Many licensed amateurs were
completely clueless in that respect.

> > Even the LANDLINE BBS (not amateur radio) community realized in the mid 1990's

> to get started on.

In our case (several BBS's including mine - all networked WWIV boards), the
Internet was the cause. 1995 marked the year that the Internet invaded Los
Angeles. 1996 was the year that a many of us gave up. We had users demanding
newsgroups be delivered to our BBS's, interoperability of e-mail to the
Internet, etc. Some of the sysops figured out how to route their BBS network
traffic via Internet e-mail, but even that indicated a losing proposition. It
was clear: adapt (become part of the Internet) or die.

In that respect, what I'm working on for my packet system is a combination that
is "adapted": Packet mail should be internally stored the same way as SMTP
received mail, and packet bulletins stored into local newsgroups, thus also
available via NNTP. I still have some details to work out. They can still be
transferred between systems via AX.25 conventions for all I care, but the point
for survival that must be stressed is interoperability.

If they weren't concerned, then just what were they forwarding via the
Internet?

Exactly my point. Whenever anyone cites TAPR, we know they're full of it.

Someone in charge? Amateur radio is more anarchistic than anything else.

...But the point is that disasters should be few and far between, and in the
meantime (e.g. "normal operating mode"), there should be some attraction - but
these slow speeds actually drive people away.

How hard have you looked?
www.seattlewireless.org
www.sydneywireless.org.au (URL - I think; have to check).
There's two examples of something more medium to wide scale.

The Los Angeles area now has a WLAN user's group which has just started its second year. (www.socalwug.org) However, it may be more of a collection of "wardrivers" than network builders at this time.

> The organized, working networking is almost all being done at lower frequencies, and at lower data rates because this is what works best. Why they work best is seldom aparrent to a new Ham who has not had an opportunity to get a firm grasp of the laws of physics as they apply to ham radio, doesn't know much about the hobby yet, and who has instead been reading the PR material about 802.11 that is published in the Ham magazines.

Actually, only the 6 lower "channels" are in the amateur band. Therefore, those who are licensed and putting these up will want to use those frequencies, while those who are only "part 15'ers" should use the upper ones (but are sufficiently radio unknowledgeable to know this).

> That is the danger when you try to "PR" what is supposed to be rational and scientific... The natural tendency in "PR" is to accentuate the positive, and eliminate or ignore the negative, which obviously is a far cry from the basic requirements of either objectivity or reason. This creates a fog of misinformation and unreasonable expectations, most particularly affecting impressionable new Hams.

PR is just to get someone interested in an idea. However, after one's interest is piqued, there's no excuse for not doing further research into what the concept actually means. Those who really care will be able to identify the misinformation and thus avoid it.
